1.0 Study Authority

The Galveston Intracoastal Waterway (GIWW) Beneficial Use of Dredged Material (BUDM) Study was conducted under the authority of Section 204 of the Water Resources Development Act of 1992, as amended and administered under the United States Army Corps of Engineers (USACE) Continuing Authorities Program (CAP).

1.1 Project Location and Purpose

This project is located within the Galveston and Aransas Counties, Texas. The GIWW is a section of the Intracoastal Waterway located along the Gulf Coast of the United States. It is an inland waterway stretching approximately 1,100 miles from St. Marks, Florida to Brownsville, Texas. In Texas, the main channel of the GIWW extends 379 miles along the coastline from the Sabine River at the Louisiana border to Brownsville, Texas.

The purpose of this study is to develop a TSP for the BUDM to restore and create healthy marshes and habitat along the GIWW. Texas coastal habitats along the GIWW are at risk for erosion. The Engineering Appendix documents the evaluations and design analysis in recommending a restoration plan.

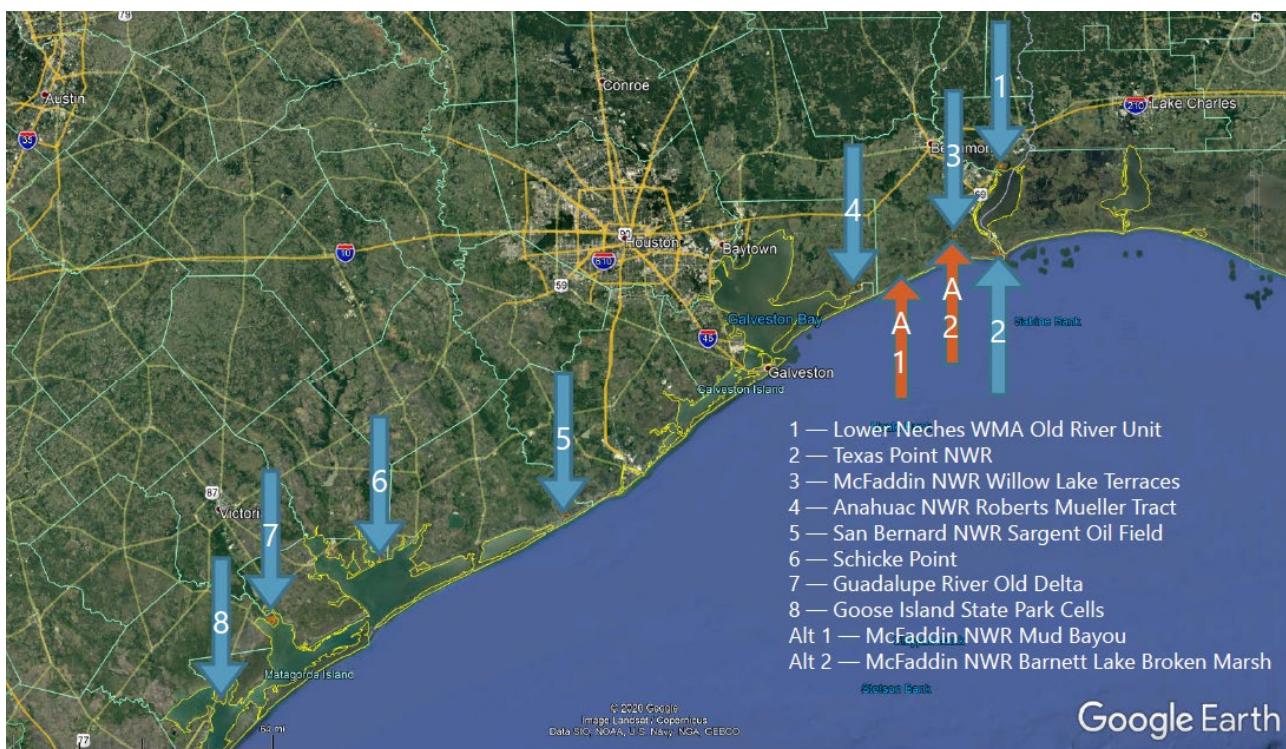

Figure 1.1 Location of Selected Sites

1.2 Existing Placement Site Locations

During preliminary investigations, the GLO identified ten existing locations along the GIWW for potential placement of dredge material.

Lower Neches WMA (Wildlife Management Area) Old River Unit has a project size of 224 acres and located in the wildlife refuge in Bridge City, Texas.

Texas Point NWR (National Wildlife Refuge) has a project size of 623 acres and is located on the upper Texas Coast near the Louisiana border in Sabine Pass, Texas.

McFaddin NWR (National Wildlife Refuge) Willow Lake Terraces has a project size of 218 acres and located in Sabine Pass Texas.

Anahuac NWR (National Wildlife Refuge) Roberts Mueller Tract has a project size of 552 acres and located in Anahuac, Texas.

San Bernard NWR (National Wildlife Refuge) Sargent Oil Field has a project size of 202 acres and located in Brazoria, Texas.

Schicke Point has a project size of 116 acres and located in Schicke Point, Texas.

Guadalupe River Old Delta has a project size of 1,085 acres and is located between Hynes Bay and Guadalupe Bay.

Goose Island State Park has a project size of 23 acres and located in Rockport, Texas.

Alt 1 McFaddin NWR (National Wildlife Refuge) Mud Bayou is located in Sabine Pass, Texas.

Alt 2 McFaddin NWR (National Wildlife Refuge) Barnett Lake Broken Marsh is located in Sabine Pass, Texas.

1.3 Proposed Sites Investigated

The No Action Plan, also known as the future without project condition, would allow erosion to continue along the GIWW. From the ten potential site locations listed, three sites were not federally owned and were chosen for further screening with the Resource Agency representatives and the PDT. Those sites are Schicke Point, Guadalupe River Old Delta and Goose Island State Park. The remaining seven sites were screened out for ownership reasons such as federally owned lands with the WMA. These sites could possibly benefit from restoration, but ownership would present implementation risks. The three potential placement sites chosen for plan formulation proposed saline marsh creation with additional features to maximize beneficial use of dredge material. Each had comparable dredging constraints for environmental windows, booster pump needed for comparable piping distance, and variable potential O&M dredging volumes.

Schicke Point was screened out because of a lack of ecological benefits. It is currently accreting sediment and any additional placement could smother the growing marsh.

Guadalupe River Old Delta was screened out because of private land ownership constraints.

Goose Island State Park was the best and most viable site location and was selected for further study.

1.3.1 Selected Site with Alternatives

Goose Island State Park Alternatives— After selecting Goose Island as the most viable placement site, five alternatives were developed to achieve the study objective that place dredge material to create an elevation suitable for saline marsh creation and sustainability. These alternatives maximized the placement of available material with the existing breakwater, cells and channel.

The five alternatives proposed for Goose Island State Park are:

Alternative 3A – Saline marsh in existing cells

Alternative 3B – Saline marsh in existing cells and living shoreline

Alternative 3C – Saline marsh in existing cells, addition of new low and high emergent marsh cells

Alternative 3D – Saline marsh in existing cells, addition of new low and high emergent marsh cells

Alternative 3E – Saline marsh in existing cells, addition of new low and high emergent marsh cells and living shoreline

The five alternative plans for Goose Island State Park are discussed in more detail in the H&H Section 2.0.

After the Cost Effectiveness Incremental Cost Analysis was completed for the five alternatives, Alternative 3D was identified as the Best Buy Plan. Alternative 3D is the TSP, the recommended Plan.

The available borrow source for the TSP is 500,000 CYS and is dredged from the Matagorda Bay to Corpus Christi Bay Reach between Sta 1160+000 and Sta 1225+000. Dredging occurs in this reach approximately every two years. The next contract would take place in the fiscal year 2024 depending on channel shoaling. The FWOP Condition would mean the sediment would continue to be placed in upland disposal PA No.131 and open water PA Nos. 132 through 136.

2.0 H&H Section - Introduction

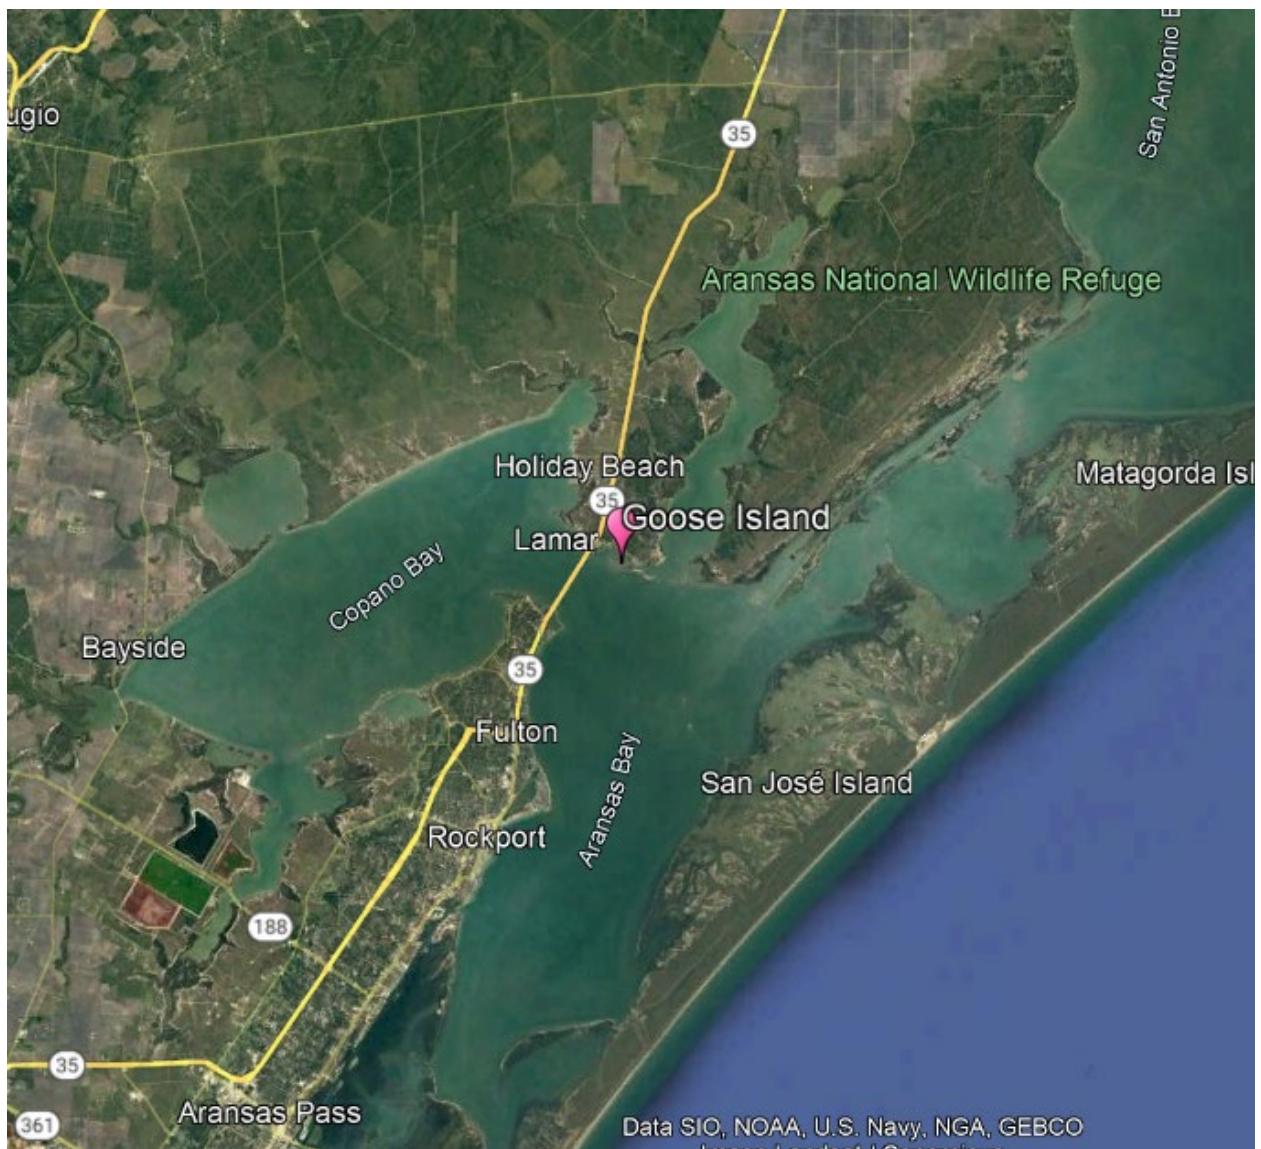

Figure 2.1 Regional Map

Figure 2.2 Area Map

The focus of this feasibility study is to investigate the options around placing O&M material in Goose Island to build up marsh and create future capacity for the surrounding O&M placement areas for the GIWW and other federally maintained channels surrounding Goose Island.

2.1 Background

In 2005 the Texas Parks and Wildlife erected a stone breakwater in front of Goose Island to attenuate wave energy to aid in the preservation of the island. In addition to that TPW also erected two earthen ring berms as future placement areas and marsh creation. This has generally performed well. There are currently four FWP alternatives being considered as well as the FWOP alternative. At the beginning another alternative (3E) which includes saline marsh in existing cells and addition of new low and high emergent marsh cells and living shoreline. But it was removed from consideration once it was realized that there were seagrass impacts which would require mitigation. As we don't do ER projects that require mitigation, only four alternatives are carried forward.

2.2 Assumptions

Because a GIS layer for the survey was unable to be provided it was assumed that each of the contour's edges were vertical. While this is unrealistic the differences in quantities will not be drastically different since the contours range between 0.3ft and 1.2ft in depth.

It was assumed that the maximum wave height that the containment berm would see would be depth limited since there was not available AIS data for the vessels that utilize the channel adjacent to Goose Island.

2.3 Design Criteria

The design/alternative that is chosen needs to be able to accommodate the estimated amount of dredge sediment and needs to have the ability for future dredge sediment placement. Depending on the type of dredge sediment, and the placement method this loss can be between 30 and 50 percent. Alternative needs to be able to have substantial ecological benefits as well. This means the creation of marshes, living shorelines or upland habitat.

2.4 Analysis and Design

2.4.1 Bathymetry

NOAA has some lidar data within the current placement area, but that data was unable to be provided to us in a GIS file. As for the Bathymetry NOAA nav charts had to be utilized. While this is not optimal it was the only method that we had available to us until this project is authorized and funded. At which point more advanced surveys of the area will be done and the analysis and quantities will be further refined to better define the final design.

2.4.2 Relative Sea Level Rise (RSL)

RSL RSL and water surface elevations throughout the life of the structure were calculated using the USACE RSL calculator (https://cwbi-app.sec.usace.army.mil/rccslc/slcc_calc.html) using the closest active tide gage located at the Rockport TX. Assuming a 50-year life span with a project start date of 2023, and a mid-point epoch of 1992.

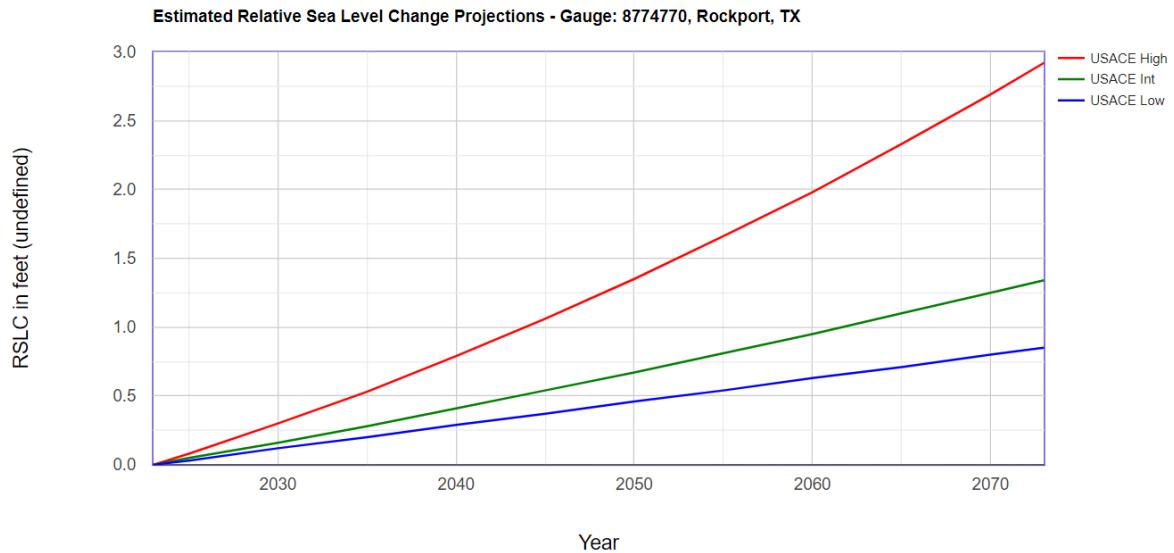

Figure 2.3: Estimated Relative Sea Level Change Graph (Rockport Gauge)

**Estimated Relative Sea Level Change
from 2023 To 2073**
8774770, Rockport, TX
NOAA's 2006 Published Rate: 0.01693 feet/yr
All values are expressed in feet
Gauge Status: Compliant

Year	USACE Low	USACE Int	USACE High

2025	0.03	0.05	0.08
2030	0.12	0.16	0.30
2035	0.20	0.28	0.53
2040	0.29	0.41	0.79
2045	0.37	0.54	1.06
2050	0.46	0.67	1.35
2055	0.54	0.81	1.66
2060	0.63	0.95	1.98
2065	0.71	1.10	2.33
2070	0.80	1.25	2.69
2073	0.85	1.34	2.92

Figure 2.4 Estimated Relative Sea Level Change Table (Rockport Gauge)

By taking into account the sea level rise from the mid-year epoch 1992 and moving the data to now create a new 0 at 2023, this was done so the reader would not have to subtract the past sea level rise but instead be able to see future at a glance. Using the USACE intermediate curve there is a calculated sea level rise of 1.35 feet in 50 years using Intermediate curve. At this point 1.35 ft is not something we concerned with due to the nature of the design and the purpose of the project but has been considered for levee crest height determination. During the PED phase, the USACE will continue to refine the engineering design to promote broader resilience, improve climate preparedness, and reduce vulnerabilities through adaptation to climate change. It is relatively easy to adapt the marsh cells to sea level change. Additional sediment can be included to offset losses from sea level rise. The containment dike elevation will need to be raised in response to sea level rise to maintain the design performance. As a rule of thumb, it is recommended that the crest elevation be increased in 1-foot increments in the future to accommodate sea level rise.

2.4.3 Winds

USACE Wave Information Study (WIS) was consulted to verify the primary direction of winds. WIS station 73042 showed an average windspeed of 7.38 knots in from 157.5 and 135 degrees (south east).

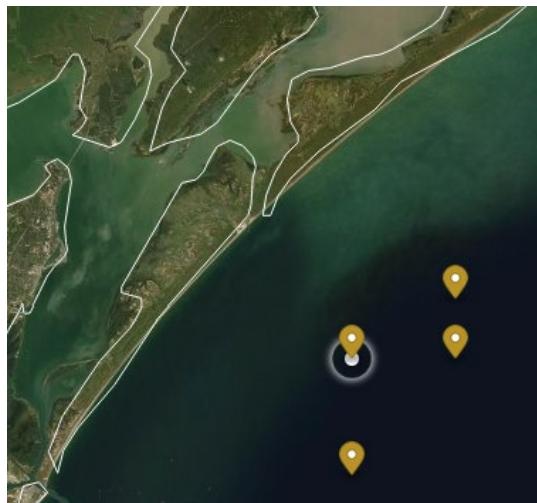

Figure 2.5

WIS Gulf of Mexico Hindcast: 73042
 1980-01-01T01:00:00Z - 2020-01-01T00:00:00Z
 Loc: -96.75° / 27.95° Depth: 19.0 [m]
 Total Obs: 344736

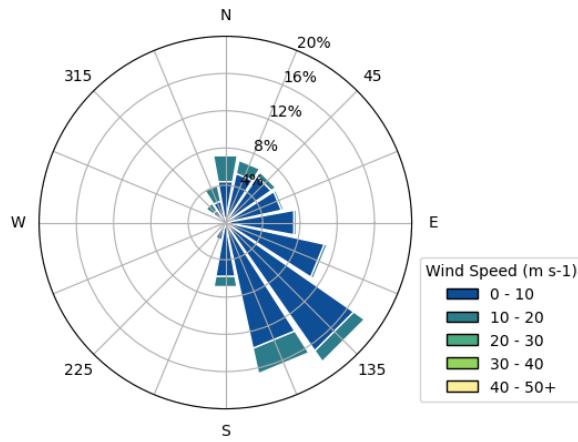

Figure 2.6 Wind Rose for WIS Station 73042

2.4.4 Ship Induced Waves

The only channel nearby is a small private channel for the local residents. Because these vessels are not commercial vessels AIS data is limited to nonexistent. Therefore, it is assumed the maximum ship induced wave at high tide with a breaking criteria of .78 would be the design wave. The result of that maximum possible ship induced wave is 1.8ft.

2.4.5 Design Winds

The design wind was identified by consulting the ASCE 7 Hazard Tool (<https://asce7hazardtool.online/>). The 10-year 3-second gusts, 50-year 3-second gusts and 100-year 3-second gusts all at 33-ft were identified to be 79 mph, 114 mph, and 125 mph (respectively) for Exposure C Category II.

However, the only area that is not already protected by a breakwater has a fetch of only a few hundred feet and will not see any significant waves. The area on the south side of the PA does have a fetch in the primary direction of wind of 6 miles, but this area already has a constructed breakwater that has been in place for approximately 20 years and has showed no signs of failure. Therefore, there is no intention to redesign a structure that has 2 decades of acceptable performance history.

2.4.6 Coastal Texas Modeling Waves

Modeling results from the Coastal Texas study (CTX) were gathered for wave height and water surface elevation for the 1,2, 5, 10, and 50 year return periods for the point at 28.131232°, -96.992759°. While this model is considered to be reliable and comprehensive it does however lack corresponding wave period with significant wave heights and water surface elevation. .

Figure 2.7 shows the nearby CTX station and significant wave heights with return periods at 95% confidence level.

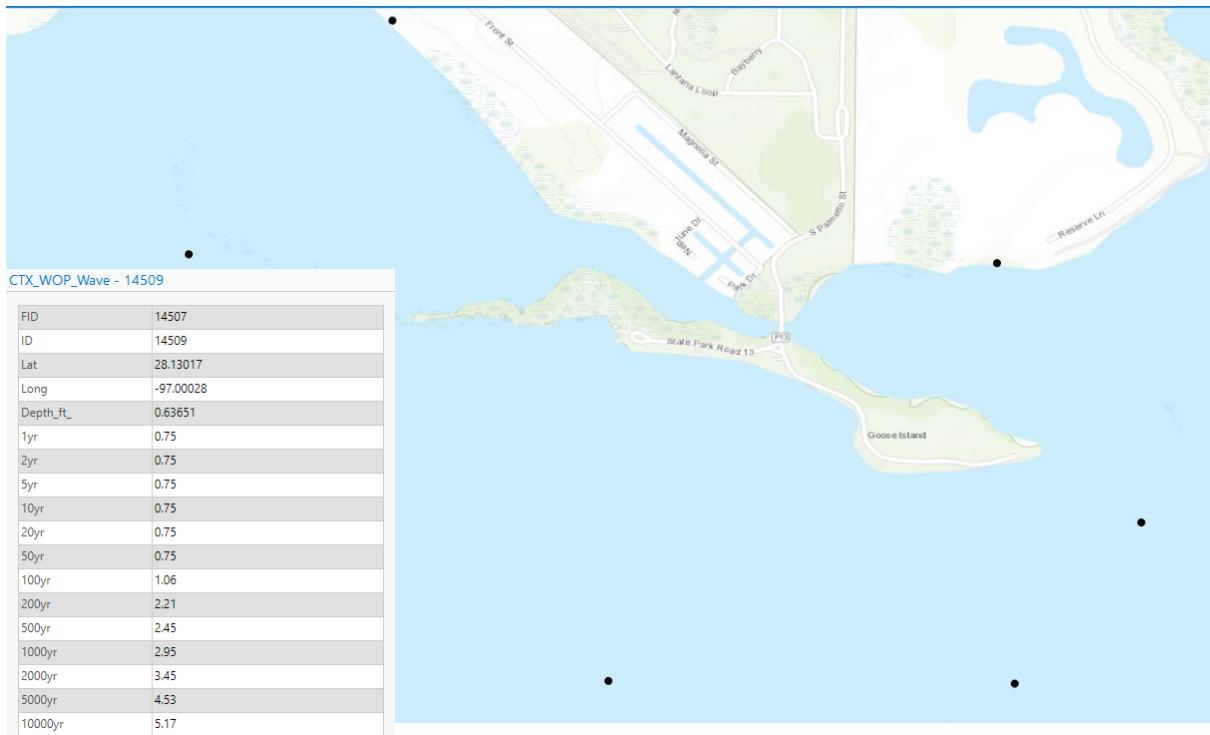

Figure 2.7: CTX station and significant wave heights with return periods at 95% confidence level

2.5 Design Summary

2.5.1 Alternative 3a

Target emergent marsh elevations for the 23 acres (cell 1 and 2) range between 0.6 and 0.8 foot NAVD88 but may be up to 1 foot NAVD88 for final elevations. This alternative will likely result in left over material, but we would like to present it that way to argue for more restoration in the subsequent alternatives.

Figure 2.8 Alternative 3a Map

2.5.2 Alternative 3b

This alternative seeks the same emergent marsh elevations for Cells 1 and 2 as described in Alternative 3a and will include a living shoreline that would begin at the containment levee and slope outwards from the marsh. The living shoreline should meet the marsh elevation at the levee and should not exceed 1 foot NAVD88 elevation. The size and extent of the living shoreline will be dependent on the material available after placing dredge in cells 1 & 2. Living shoreline will be 20 ft crest with 1:20 slope and roughly 80 ft wide which will be determined after detailed surveys are conducted. Typical sections are developed and added later.

Figure 2.9 Alternative 3b Map

2.5.3 Alternative 3c

This alternative seeks the same emergent marsh elevations for Cells 1 and 2 as described in Alternative 3a, with a possible 5 acre and 1.5-acre upland area on the south side of cells 1 and 2 and will include an additional cell north of Cell 1. The additional cells to then north would be 9.5 and 6.5 acres and would be constructed to an elevation of 0.8 ft. This would require constructing a containment levee, using material sourced from the project area gradual slope to the lower elevation marsh shall also be provided. The containment dike will be 6 ft crest width at +3.0 NAVD 88 with a 5:1 slope on both sides of the berm with a depth at toe of -1.5 ft NAVD88. Existing dike also will be raised 1 ft from its current elevation due to future sea level rise and settlement.

Figure 2.10 Alternative 3c Map

2.5.4 Alternative 3d

This alternative seeks the same emergent marsh elevations for Cells 1 and 2 as described in Alternative 3a and will include new cells north of the current ones as described in (c), but place the higher elevation in the new cells and emergent marsh in adjacent areas. The total habitat acreage would be similar to that described in (c). This would require constructing a containment levee, using material sourced from the project area, to encompass a 16 acre area that would seek a higher elevation than the new cell north of cell in (c). The target elevation provided by TPWD for the higher elevation marsh (uplands) is 1.5-2.0 feet, but the size may be dependent on available dredge material. A gradual slope to the lower elevation marsh shall also be provided. The containment dike will be 6 ft crest width at +3.0 NAVD 88 with a 5:1 slope on both

sides of the berm with a depth at toe of -1.5 ft NAVD88. Existing dike also will be raised 1 ft from its current elevation due to future sea level rise and settlement.

Figure 2.11 Alternative 3d Map

2.6 Quantities

2.6.1 Alternative 3a

Alternative 3a would simply be a placement of material not to exceed 1.0ft NAVD88 within the current containment levees. The quantity for this would require 52,500 cubic yards of material, with losses, bulking and settlement. This alternative needs to raise the existing dike of 7220 ft to raise 1 ft extra with a volume needs 13700 CY. This quantity was calculated by taking the area of each contour interval and multiplying it by the depth of material for each contour interval (contour intervals vary). After a total volume per contour interval was calculated, the value was

then added to each subsequent volume below for a total volume of material that can be placed. While this is not the optimal method of calculating the total volume a GIS file was not provided and due the time constraints it will have to suffice for now. Table 2.1 shows the quantity.

Table 2.1

Dredge material quantity (CY)	Containment Dike construction/raising (LF)	Containment Dike construction/raising (CY)
52,500	7,220	13,700

2.6.2 Alternative 3b

Alternative 3b would be a creation of a living shoreline attached to the existing containment levee. The living shoreline design would be dependent on available material but for sake of quantity calculations a 80ft living shoreline from the centerline of the existing containment levee to the toe of the new shoreline was considered.

Figure 2.12 Alternative 3b with Defined extent of Living Shoreline

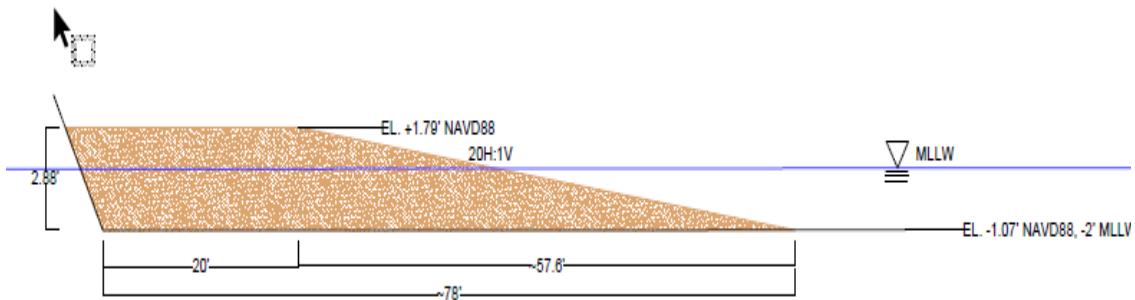

Figure 2.13 Living Shoreline Cross Section

The quantity calculations were split up in two sections to offer more flexibility in considering the alternative. Between the orange lines on the channel side and between the blue lines on the breakwater side. A 3rd sub alternative was also considered combining the two. The quantities for the breakwater side will not be overestimated since it assumes a uniform containment levee which is not the case on the breakwater side. This alternative will require 82,500 cubic yards of sediment. The Table below (2.2) depicts the total sediment needed. This alternative needs to raise the existing dike of 7220 ft to raise 1 ft extra with a volume needs 13700 CY.

Table 2.2 Alternative 4b Living Breakwater Quantities

Dredge material quantity (CY)	Containment Dike construction/raising (LF)	Containment Dike construction/raising (CY)
82,500	7,220	13,700

2.6.3 Alternative 3c

Alternative 3c utilizes a combined total of 6.5 acres upland habitat within the existing PA cells. This would require 193,000 cubic yards of material to build to a height of +2 NAVD88. Additional material can be used to grade the slope out to a smooth transition or less material can be used to grade the slope out to a smooth transition based on what the PDT decides to on the final lateral extent of transition zone from marsh to upland. Since the GIS file was not provided, areas per 1 ft contour were taken using the survey data that was provided. Each quantity was calculated and added to each subsequent quantity for a total placed material quantity. This does not take into account a slope so in theory the toe of the upland habitat will extend beyond the drawn outline, and the crest will be inside of the yellow outline and the slope would be based on the angle of repose. If this plan is selected a more accurate quantity will be calculated based on engineered drawings.

In addition to the upland habitat a 16-acre new marsh system will be created at elevation 0.00 NAVD88. With the average depth of -2 ft MLLW (-2.93 NAVD88) taken from NOAA Navigational charts. The new marsh will also need a containment berm. The berm that TPW used for the initial containment berm has been requested to be used for the calculation of the new

containment berms. This is a 6 ft crest width at +3.5 NAVD 88 with a 5:1 slope on both sides of the berm with a depth at toe of -2.93 NAVD88 and a total lateral length of 2,721 ft. The containment berm would have a cross-sectional area of 128 square feet for a total of 36000 cubic yards considering settlement. This alternative needs to raise the existing dike of 7220 ft to raise 1 ft extra with a volume needs 13700 CY. Table 2.3 shows the quantity needs for this alternative.

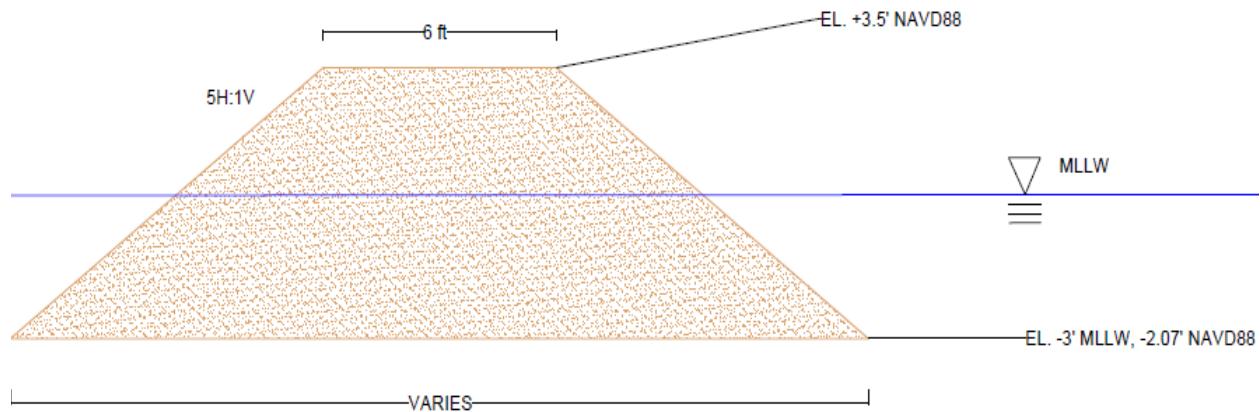

Figure 2.14 Alternative 3c and 3d Containment Dike X-Section

Table 2.3 Alternative 3c Quantities

Dredge material quantity (CY)	Containment Dike construction/raising (LF)	Containment Dike construction/raising (CY)
193,000	10,220	36,000

2.6.4 Alternative 3d

This alternative is similar to alternative 3C. This alternative seeks the same emergent marsh elevations for Cells 1 and 2 as described in Alternative 3a and will include new cells north of the current ones as described in (c), but place the higher elevation in the new cells and emergent marsh in adjacent areas. The total habitat acreage would be similar to that described in (c). The new marsh will also need a containment berm. The berm that TPW used for the initial containment berm has been requested to be used for the calculation of the new containment berms. This is a 6 ft crest width at +3.5 NAVD 88 with a 5:1 slope on both sides of the berm with a depth at toe of -2.93 NAVD88 and a total lateral length of 2,721 ft. The containment berm would have a cross-sectional area of 128 square feet for a total of 36000 cubic yards considering settlement. This alternative needs to raise the existing dike of 7220 ft to raise 1 ft extra with a volume needs 13700 CY. Table 2.4 shows the quantity needs for this alternative.

Table 2.4 Alternative 3d Quantities

Dredge material quantity (CY)	Containment Dike construction/raising (LF)	Containment Dike construction/raising (CY)
196,500	10,220	36,000

2.7 Conclusion

Alternative 3d would be able to accommodate the most dredge material at 196,500 cubic yards of material after bulking, dredge losses, and settlement are all taken into account. While Alternative 3c would be able to accommodate 193,000 cubic yards of dredge material after bulking, settlement and losses. Alternative 3b would only allow for 82,500 cubic yards of dredge material to be utilized. Below are the results while Alternative 3a would allow for 52,500 cubic yards of dredge material to be utilized. Table 2.5 summarizes quantities related to all alternatives.

Table 2.5 – Summary of Quantities

Alternative	Dredge material quantity (CY)	Containment Dike construction/raising (LF)	Containment Dike construction/raising (CY)
3a	52,500	7,220	13,700
3b	82,500	7,220	13,700
3c	193,000	10,220	36,000
3d	196,500	10,220	36,000

All of the quantities take into account the losses through the dredging and placement cycle. Based on previous studies for beach placement it is reasonable to expect 25% -50% losses depending on the placement area and method. A 1.5 bulking factor was taken into account which was provided by Geotech. Likewise, all settlement was provided by Geotech.

The vessels that utilize the channel are not commercial vessels therefore there is no AIS data available for the small channel that runs behind Goose Island. Therefore, the more conservative method of back calculating the maximum wave height from a vessel based on a 0.78 breaking criteria and a 2.78 ft (MHHW) depth at toe was used.

Wind waves were taken from the Coastal Texas Study GIS layer and looked at. The 50yr return period significant wave height was 1.5 ft in-front of the breakwater where depth and fetch are greater. This point was used due to not having a data point closer to the revetment in the more protected portion of the bay that was being analyzed. The shallower and protected area of interest would not have waves that exceed 1.5 ft. Therefore, the wind waves were not considered for the revetment stone protection since the maximum vessel generated wave (1.8ft) is the dominate force.

3.0 Geotechnical

The recommended plan (Alternative 3d) includes a restoration/raise of an existing 23-acre marsh (cells 1 and 2) to a target elevation between 0.6 and 0.8 feet NAVD88. The plan also includes construction of two new emergent marsh cells (cells 3 and 4) located the North of the existing cells 1 and 2. The sizes of the new cells 3 and 4 are 9.5 acres and 6.5 acres, respectively. An upland area located between the existing marsh and the new cells 3 and 4 would be constructed to target elevations between 1.5 and 2.0 feet NAVD88. The remaining area in cells 3 and 4 (9.5 acres and 6.5 acres, respectively) would be filled to target elevations of 0.6 and 0.8 ft NAVD88. The upland area would be gradually sloped to meet the lower elevation of the emergent marsh. A new 2,721-foot-long containment berm would be constructed to retain dredge material for cells 3 and 4. Refer to Figure 3.1 for overall details of the recommended plan (Alt. 3d).

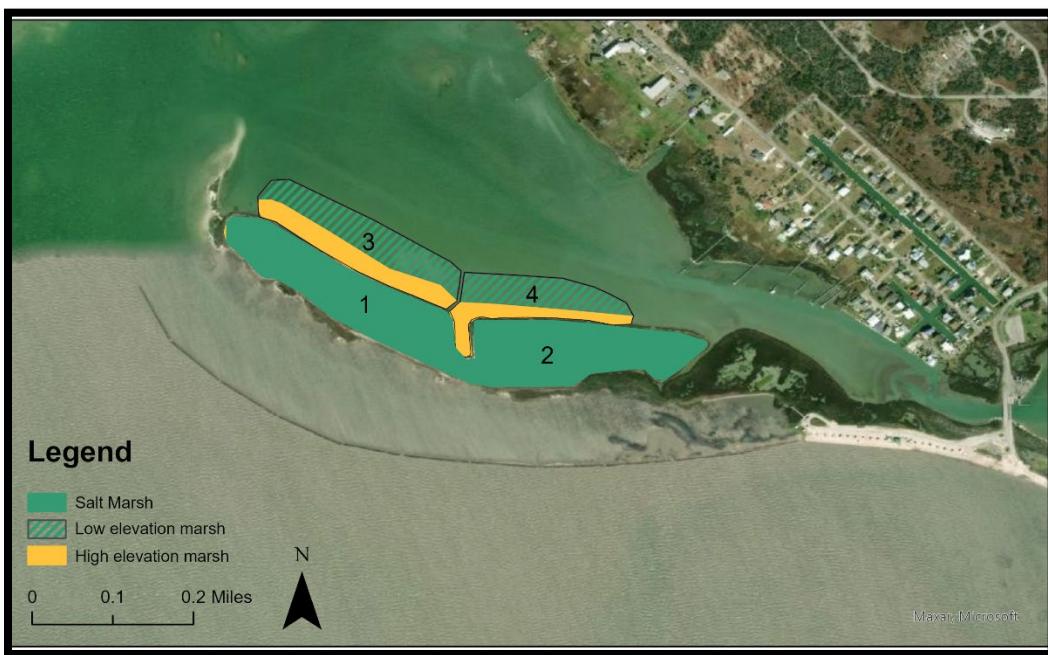

Figure 3.1 Alternative 3d (Recommended Plan)

3.1 Local Geology

The reference used for descriptions of the local geology is Paine, J.G., and Collins, E.W., 2016, Geologic Map of the Saint Charles Bay quadrangle, Texas Gulf of Mexico Coast: University of Texas at Austin, Bureau of Economic Geology, Open-File Map OFM0025, scale 1:24,000 (https://ngmdb.usgs.gov/ngm-bin/pdp/zui_viewer.pl?id=62835). The local geology in the study area consists primarily of bay margin deposits which includes undivided island deposits of mud and sands with marsh vegetation. The regional geology consists of primary deposits of Beaumont Formation (Qb) which has been intersected and infilled with Recent Alluvium (Qal) from the meandering Nueces River. Typically, the Alluvium deposits are thicker towards the inner portion of Copano Bay and thin out towards San Jose Island. In several areas the Alluvium

may be overlain by dredge fill or spoil from active dredging activities in the vicinity. Regional geology map for the site is presented in Figure 3.2.

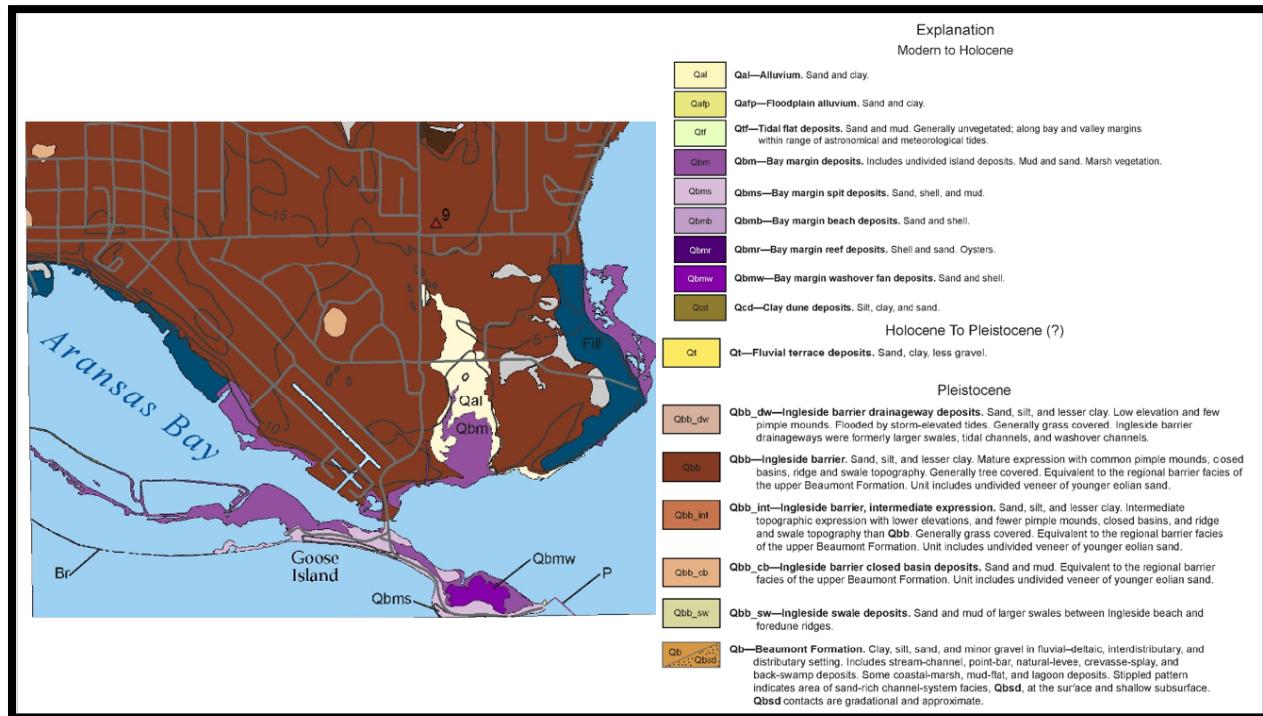

Figure 3.2 Goose Island - Regional Geology from 2016, Geology from Map of the Saint Charles Bay quadrangle, Texas Gulf of Mexico Coast: University of Texas at Austin, Bureau of Economic Geology

3.2 GIWW O&M Historic Sediment Data (GIWW Reach Sta 1160+000 to 1225+000)

Sediment data for Operations and Maintenance (O&M) dredge materials in the GIWW near the project site can be found in the “GIWW – Across Aransas Bay Containment Assessment Report, Aransas Bay Sampling and Analysis Results” (2017) document prepared by Lloyd Engineering, Inc. and located in Attachment A of this appendix. Dredge materials from the GIWW reach from Sta. 1160+000 to Sta. 1225+000 are planned to be used for marsh creation. See Figure 3.3 for sediment sample locations and Table 3.1 for grain size analysis results.

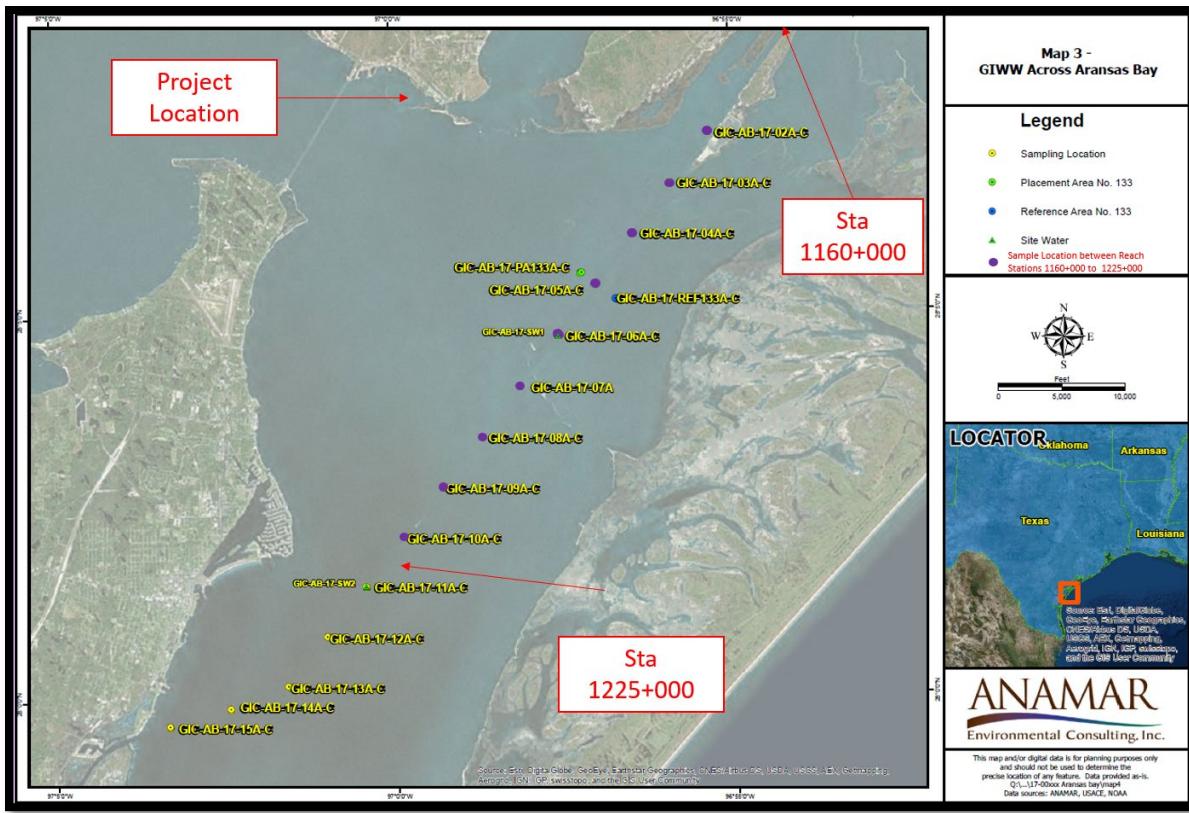

Figure 3.3 GIWW Sampling Map of Routine Maintenance Dredging Operations

Table 3.1 Sample Locations and Grain Size Analysis between reach of GIWW Sta 1160+00 to Sta 1225+00

Sample ID	Sample Number	Location (State Plane NAD83)		Gravel	Sand	Silt	Clay
		Easting	Northing

Sediment sample grain size analysis indicates the dredge material consists of 0.87 to 39.4 percent sands, 42.3 to 70.7 percent silts, and 18.2 to 36 percent clays. None of the samples contained very coarse sand, gravel, or larger particles.

Understanding the composition of the dredge material provides insight into the physical behavior dredge material during dredging operations. Of primary interest is identification of an appropriate bulking factor of the dredge material. Dredging and placement of the O&M dredged material from the GIWW is anticipated to be performed using a cutterhead dredge with hydraulic pipeline conveyance to the project site for marsh creation. Engineer Manual 1110-2-5025 Dredging and Dredged Material Management defines bulking factor as "the ratio of the volume occupied by a given amount of dredged material in a containment area in either a hopper or a placement area immediately after deposition by a dredging process to the volume occupied by the same amount of soil in situ. The bulking factor is affected by soil material, mass, and behavior characteristics as well as different types of dredges and dredging techniques." The bulking factor can be calculated as follows:

$$\text{Bulking Factor} = \frac{(\text{Volume of Dredged Material in Marsh})}{(\text{Volume in Channel prior Dredging})}$$

The bulking factor is a design parameter primarily used to calculate the volume taken up by the just-dredged material in the marsh cells and thus identification of the dike or berm elevations required to contain the material. New-work material tends to have a higher bulking factor than maintenance material because normally it is in a more consolidated in-situ state compared to the

routine dredging material which has been deposited by soil sedimentation process. Per EM-1110-2-5025, a general rule of thumb is the larger the grain size, the lower the bulking factor (sand 1.0 to 1.2, silt 1.2 to 1.8, and clay 1.5 to 3.0). Based on the available sediment grain size data most of the O&M material to be dredged from the GIWW between Sta. 1160+000 to Sta. 1225+000 will consist predominantly of silt with smaller percentages of clay and sand. Therefore, the anticipated bulking factor is expected to range from about 1.2 to 1.8. For this project, a bulking factor of 1.5 was assumed for quantity calculations

3.3 Historic Geotechnical Data (Study Area – Goose Island)

A geotechnical investigation was not performed for this study given budgetary and scheduling constraints. Limited analyzes was conducted and consisted primarily on bearing capacity of the containment berm foundation. Based on the geological maps it appears the subsurface strata consist of loamy sands. Loamy sands in the area are normally a sand mix with silts and clay and/or interbedded thin layers of these materials within the upper 5 feet of the extent mudline. An online search was performed on Texas General Land Office (GLO) Tx SED website (<https://cgis.glo.texas.gov/txsed/index.html>) for existing geotechnical soils data in the project area. One historical boring was found in the vicinity of the project. The The boring, designated as B-1, was performed by Rock Engineering & Testing Lab in 2011 to a depth of 15 feet for a proposed boardwalk project in Goose Island State Park. See Figure 4 for the approximate location of this boring and Attachment B for the boring log. Based on the information shown on the boring log, subsurface strata generally consists of a 3-foot thick upper layer of loose poorly graded sand (SP) underlain by about 2.5 feet of very soft Fat Clay with sand (CH) then sandy lean clays (CL) to the boring termination depth. Standard Penetration Test blow counts per foot (N) for the clays ranged from 1 to weight of hammer (WHO). No additional strength test results were available for the boring B-1 samples. In summary, the data indicates the presence of 3 feet of loose loamy sand underlaid by a 12 feet of very soft compressible clays. It is recommended that additional soil investigation be completed during the design and implementation phases to more completely characterize the soil stratum in the project area.

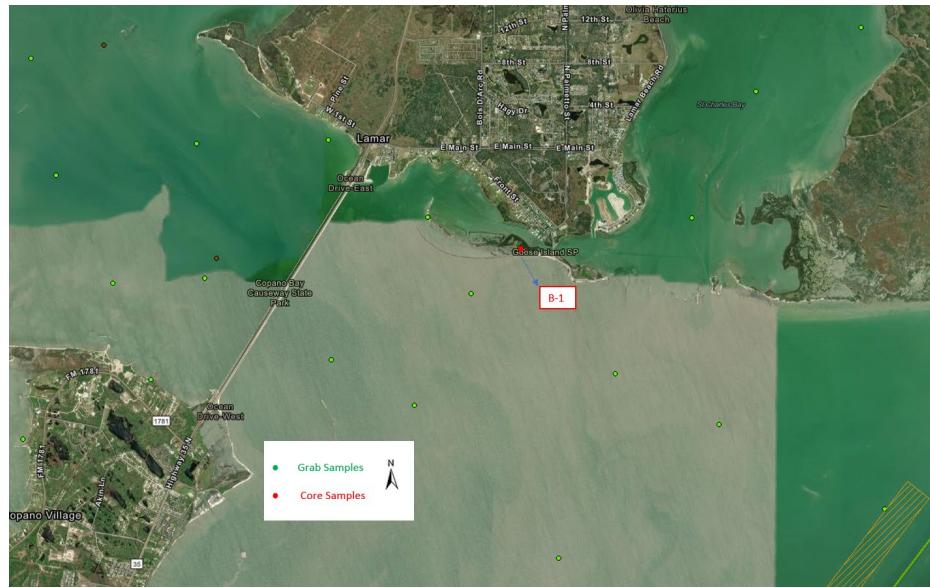

Figure 3.4 Aerial Photo of data available in and around study area (GLO, 2022).

3.4 Feasibility Level Design – Marsh Restoration / Creation

Maintenance dredged material from the GIWW between about Sta. 1160+000 and Sta. 1225+000 will be used for the creation of the marsh cells 3 and 4 and restoration/raise of existing cells 1 and 2. Based on the available soils data, the subsurface conditions at the project site is assumed to consist of about 3 feet of loamy sand underlaid by 12 feet of very soft compressible sandy fat to lean clays. The maintenance dredge material for marsh creation is anticipated to be predominantly silts with some clay and little to no sands. Settlement estimates for the marsh can may range as much of 20 to 50 percent. A settlement of 35 percent was assumed for the marsh fill for quantity calculation. The nature of the expected maintenance dredge material for marsh creation (fill) construction will probably require an intensive pipe management effort and field work equipment to properly grade material to the desire target elevations. Marsh creation/restoration features will need to be properly evaluated in PED, including settlement analysis.

3.5 Feasibility Level Design – Containment Berm

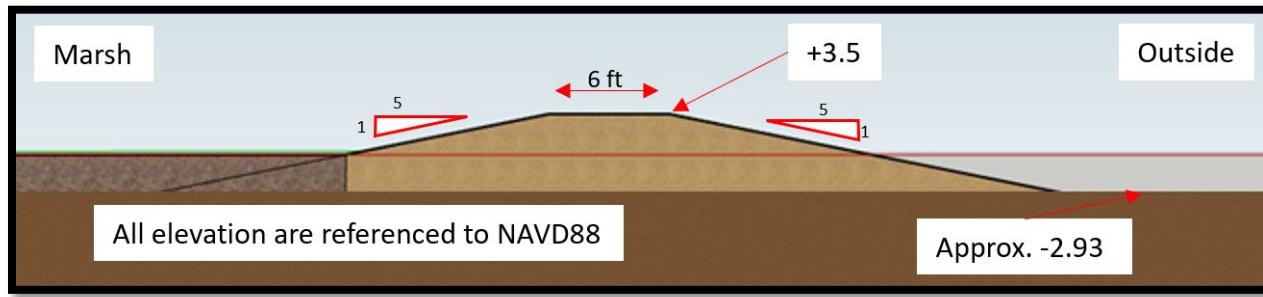

Figure 3.5 Containment Berm Configuration

A new containment berm will be required for the new marsh cells 3 and 4. In addition, the existing containment berm at cells 1 and 2 will be raised. The containment berm template selected for this project is as proposed by the NFS Texas Parks and Wildlife Department (TPWD). The berm template includes a 6-foot crest width at EL +3.5 feet NAVD88 with a 5H:1V side slopes. Estimated berm toe elevation is about EL -2.93 feet NAVD88. The total length of the berm at cells 3 and 4 is 2,721 feet. A limited bearing capacity analysis of the bearing capacity based on existing soils data follows as preliminary design to help understand critical components of the foundation.

Using the classical limiting equilibrium analysis for strip footing Terzaghi's Ultimate Bearing Capacity Equation (Eq. 16.11 Braja M. Das, 2010 edition 7)

$$q_u = c'N_c + \gamma D_f N_q + 0.5 \gamma B N_\gamma \quad (\text{continuous footing})$$

where N_g N_q N_c are the bearing capacity factors

D_f = location from the surface elevation (ft)

B = foundation width (ft)

γ = unit weight (lb/ft^3) at the foundation

c' = Undrained shear strength (lb/ft^2)

Assumed values:

$$B = 46 \text{ ft}$$

$$\gamma = 90 \text{ lb}/\text{ft}^3$$

$$\phi = 0, \text{ therefore } N_c = 5.14 \text{ (clay), Ref. EM 1110-1-1905 Table 4-4 (Vesic)}$$

The ultimate bearing capacity (Clay)

$$\begin{aligned} q_u &= c'N_c + \gamma D_f N_q + 0.5 \gamma B N_\gamma \\ q_u &= N_c S_u \\ q_u &= 5.14 \times 250 \\ q_u &= 1285 \text{ lb}/\text{ft}^2 \end{aligned}$$

Maximum Height of Containment Berm 4 foot, fill induced stress on foundation soils = 4 feet \times 100 lb/ft^2 minus buoyancy. Unit weight after placement of dredged material equal to 110 lb/ft^3

(conservative).

$$\Delta\sigma'_{vo} = \text{Vertical pressure change (lb/ft}^2\text{)} \text{ Foundation elevation at -2.93 NAVD88.}$$

$$\Delta\sigma'_{vo} = [\text{above water}] (\text{El.} +3.5 - \text{El.} 0) \text{ft} \times (110) \text{lb/ft}^3 + [\text{below water}] (\text{El.} 0 - \text{El.} -2.93) \text{ft} \times (110 - 64) \text{lb/ft}^3$$

$$\Delta\sigma'_{vo} = 519.78 \text{ lb/ft}^2$$

$$F.O.S (\text{Clay}) = q_u / \Delta\sigma'_{vo} = 2.32$$

The ultimate bearing capacity (Poorly Graded Sand) based on a very loose

$$B = 40 \text{ ft (reduced for conservative)}$$

$$\varphi = 26^\circ, \text{ therefore } N_c = 12.54 \text{ (sand) based very loose: Ref. EM 1110-1-1905 Table 4-4 (Vesic)}$$

$$\gamma = 90 \text{ lb/ft}^3 \text{ (Conservative)}$$

$$q_u = c'N_c + g Df N_q + 0.5\gamma B N_\gamma$$

$$q_u = 0.5\gamma B N_\gamma$$

$$q_u = 0.5 * (90-64) * 40 * 12.54$$

$$q_u = 6,520 \text{ lb/ft}^2$$

$$F.O.S (\text{Sand}) = q_u / \Delta\sigma > 5.0$$

Reference EM 1110-1-1905 Bearing Capacity of Soils, Table 1-2 Typical Factors of Safety, for typical some factors of safety (FS) for bearing capacity. "Those FS's can be considered conservative and will generally limit settlement to acceptable values. In general, FS should be higher than 2.5 and never less than 2.0."

As an exercise, recalculation of the bearing capacity analysis using a 1.5-foot displacement with the intent to increase FS higher than 2.50 was performed with the anticipation that Contractor will likely need to overbuild (wider and taller) the containment berm in order to have sufficient material to shape it to the desired template. Therefore, additional pressure for short period of time will be imposed during construction.

The ultimate bearing capacity (Clay) **1.5 foot displacement:**

$$B = 46 \text{ ft}$$

$$\varphi = 0, \text{ therefore } N_c = 5.14 \text{ (clay), } N_q = 1.0 \text{ (clay)}$$

$$\gamma = 90 \text{ lb/ft}^3 \text{ (Assumed)}$$

$$q_u = c'N_c + \gamma Df N_q + 0.5\gamma B N_\gamma$$

$$q_u = N_c S_u + \gamma Df N_q$$

$$q_u = 5.14 \times 250 \text{ lb/ft}^2 + (90 - 64) \text{ lb/ft}^3 \times (1.5 \text{ ft}) * 1.0$$

$$q_{u(1.5ft)} = 1324 \text{ lb/ft}^2$$

$$F.O.S (\text{Clay- 1.5 feet settlement}) = q_{u(1.5ft)} / \Delta\sigma'_{vo} = 2.55$$

Note, there is no need to recalculate bearing capacity using a sand foundation after initial round FS (FS >5.0).

Considering the above preliminary analyses (overbuild template) a 1.5-foot settlement was assumed for quantity calculations and probable construction disturbance at the foundation. It is good to be note, surrounding material will be use as borrow source for the construction of the containment berm and it will likely be in a very wet state "material". Construction method of the containment berm will probably be using a mechanical "backhoe" dredge. In general, the backhoe dredge uses a bucket that is structurally connected to a dredge by the member. Note, there is a probability of a e needs of flatter the slopes from a construction standpoint considering the stage of the material will be very wet during construction. But for purpose of the feasibility level and request by TPWD the above configuration was used for calculation purposes. The design of containment berm will need to be properly analyze with additional soils data obtained during the design phase, including (revaluation) bearing capacity, slope stability and settlement analysis.

Galveston, TX 77550

Dear Ms. Finn:

Re: GIWW – Across Aransas Bay Contaminant Assessment Report
Aransas Bay Sampling and Analysis Results
Aransas County, Texas
Contract W912HY-11-D-003, Task Order DY016

This report presents the results of the sampling and analysis of sediment, water, and elutriate chemistry, and sediment grain size conducted by Lloyd Engineering, Inc. (LEI) and ANAMAR Environmental Consulting, Inc. (ANAMAR) for routine maintenance dredging operations within Aransas Bay in Aransas County, Texas, to comply with requirements of the Clean Water Act. LEI and ANAMAR were contracted by the U.S. Army Corp of Engineers (USACE), Galveston District, to provide assistance with the sampling, and analysis of material associated with maintenance dredging operations under Contract W9126G-17-D-0034, Task Order (TO) F0055. Refer to Attachment A for figures depicting the project area and sample locations.

OBJECTIVES

The objectives of this dredging application and testing are to: (A) Collect sediment from Aransas Bay, a Federally-maintained navigation channel to adequately characterize the materials to be dredged; (B) analyze the dredged material samples for potential chemical contaminants of concern (COC) and physical characteristics to determine the materials suitability for disposal into existing Upland Confined Placement Areas (UCPA) and to identify potential placement alternatives; (C) document field sampling methods and results of physical and chemical analyses, and quality control measures; and (D) collect sufficient data to determine whether unacceptable adverse impacts would result from dredging activities and/or placement of dredged material.

METHODS

In situ standard water quality parameters were collected at the time of the sampling effort. Water quality parameters measured and recorded in the field included dissolved oxygen (DO), milligrams/liter (mg/L) and percent saturation (%sat), pH in standard units (SU), salinity in parts per thousand parts (‰), specific conductivity in millisiemens per centimeter (mS/cm), water

temperature in degrees Celsius ($^{\circ}\text{C}$), air temperature in $^{\circ}\text{C}$, and total water depth in feet (ft) at sampling locations. Global position system (GPS) coordinates were also recorded at each sampling location. Refer to Attachment B for water quality datasheets detailing the parameters observed at the time of sampling efforts.

All sampling stations noted in the Sampling and Analysis Plan (SAP) (Attachment C) were collected by LEI, according to appropriate existing standard operating procedures (SOPs) and requirements of the SAP. All chemical analyses were performed by North Water District Laboratory Services (NWDLS), Woodlands, except for grain size analysis, which was conducted by Weatherford Laboratories, Inc. Soil Characterization Laboratory. NWDLS is certified by the National Environmental Laboratory Accreditation Program (NELAP) for all chemical analyses conducted on water, sediment, and elutriate samples. All chemical analyses were conducted in accordance with the methods and requirements detailed in the SAP (Attachment C).

RESULTS

Sediment, water, and elutriate samples were collected from November 7-8, 2017, from a total of 16 sampling Locations. Table 1 provided in Attachment D presents the GPS coordinates as well as the analyses conducted at each sample location. The methods of analysis, minimum detection levels (i.e., target detection limits [TDL]) and chain of custody forms are provided in Attachment E. The Electronic Data Deliverable (EDD) Raw Laboratory Results are included in Attachment F.

Water Quality

In-situ standard water quality parameters were measured at each sampling station at the time of sample collection during sampling efforts. DO was measured at all sampling stations and ranged from 6.44 mg/L to 7.75 mg/L. PH was measured at all sampling stations and ranged from 8.08 SU to 8.60 SU. The salinity at sampling stations ranged from 20.9‰ to 26.5‰. Water temperature ranged from 22.59°C to 25.75°C . Refer to Attachment B for the water quality datasheets parameters observed and the corresponding GPS coordinates recorded during sampling efforts.

Water and Elutriate Chemistry

The results of chemical analyses for analytes detected in water and elutriate samples are presented in Table 4 and 5 (Attachment D), respectively. Also included in Table 4 and 5 are the Texas Acute Surface Water Quality Standards (TWQS), provided by the Texas Commission on Environmental Quality (TCEQ) for the protection of aquatic life.

Elutriates were prepared from test sediment and channel water, filtered or centrifuged to remove suspended material for trace metal analysis (except mercury and selenium), and submitted for chemical analysis. Elutriates provide information on those constituents that are (1) dissolved into

the water column during dredging and open-water placement and/or (2) present (worst case) in the elutriate discharge from an UCPA. An examination of Tables 4 and 5 provided in Attachment D reveals that no acute TWQS benchmarks were exceeded in the concentrations of the compounds detected in any of the water or elutriate samples.

Sediment Chemistry

TDLs are defined in the Regional Implementation Agreement (RIA) as "A performance goal set between the lowest, technically feasible detection limit for routine analytical methods and available regulatory criteria or guidelines for evaluating dredged material." There are no enforceable sediment quality criteria or standards with which to compare concentrations of compounds in sediment. However, there are several different guidelines that are used to look for a cause for concern in sediment samples, one of which is the Effects Range Low, or ERL (Buchman, 2008). When an exceedance of the ERL occurs, the effects range medium (ERM) benchmark value is then evaluated. However, since these sediments are destined for placement within an Upland Confined Placement Area, it is customary (Hauch, 2012) to also compare to the Human Health Protective Concentration Levels (PCL), provided by the TCEQ as part of the Texas Risk Reduction Program (TRRP, 30 TAC §350). Sediment concentrations of detected compounds are presented in Table 3 of Attachment D.

An examination of Table 3 provided in Attachment D reveals that exceedances of the ERL occurred at two sampling locations for Lead and Mercury. However, no ERM or PCL benchmarks were exceeded in the concentrations of the compounds detected in any of the sediment samples.

Sediment Grain Size

None of the samples contained very coarse sand, gravel, or larger particles. Material collected amongst sampling locations ranged in composition between 0.7 and 58.3 percent sand, 28.8 and 70.7 percent silt, and 12.9 and 36.0 percent clay. Refer to Attachment G for laser grain size analysis results.

SUMMARY

Sample station GPS coordinates as well as the analyses conducted at each sample location are provided in Table 1 of Attachment D. Water quality parameters taken at the time of collection are presented in Attachment B. Tables 3, 4, and 5 of Attachment D list the COC concentrations detected in sediment, water, and elutriate samples, respectively. Also included in Tables 3, 4, and 5 are appropriate standards, criteria, or screening values to which the detected parameters can be compared.

Exceedances of ERL benchmark values for Lead and Mercury occurred in two sediment samples collected. Exceedance of the ERL for Mercury occurred at sampling location GIC-AB-17-12. Exceedance of the ERL for Lead occurred at sampling location GIC-AB-17-07. However, no ERM or PCL values (as provided by TCEQ Table 4, Combined Tier 1 Soils PCLs, Commercial/Industrial, 030-acre Source Area, Last Revised: March 31, 2017) were exceeded in any of the samples. Additionally, none of the COC concentrations detected in any of the water or elutriate samples were found to be in exceedance of any acute TCEQ WQS.

Sediment results show that no ERM or PCL benchmarks were exceeded in the concentrations of the compounds detected in any of the sediment samples. Water, and elutriate results show that no acute TWQS were exceeded in the concentrations of the compounds detected in any of the water samples. There were no exceedances of ERM, TWQS, or TCEQ PCL benchmark values.

CONCLUSION

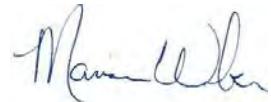

Based on the results of this assessment guidance provided by the RIA (EPA/USACE, 2003), there is nothing in the chemical analyses that would indicate a concern with the dredging and/or placement of these sediments in an UCPA or in open-water placement. No TWQSs, ERMs, or PCLs were exceeded.

Sampling and Analysis Plan

Section SF 1449 - CONTINUATION SHEET

SAMPLING ANALYSIS PLAN

SAMPLING AND ANALYSIS PLAN

SAMPLING AND CHEMICAL ANALYSIS GIWW – ACROSS ARANSAS BAY GIWW - FREEPORT TO CANEY CREEK CHOCOLATE BAYOU July 2017

Objectives

Water and sediment samples shall be collected from the Federally-maintained navigation channel, for the purpose of conducting testing to characterize the shoal material that will be excavated during routine maintenance dredging. The material shall be evaluated to determine whether unacceptable adverse impacts would result from dredging and dredged material placement operations. The evaluation will comprise chemical analyses of sediment, water, and elutriate samples, and grain-size analyses.

All sample collections and chemical analyses are to be conducted according to appropriate existing Standard Operating Procedures (SOP). Prior to sample collection, all containers and sampling equipment shall be cleaned according to protocols described in Plumb (1981), or other appropriate guidance manuals. Care must be taken to avoid contamination to sampling devices from the boat deck, or other surfaces. Powderless latex gloves shall be worn during sample collection and sample handling.

Sediment Samples

Sediment samples shall be collected with a stainless steel Ekman, Ponar, Peterson or similar dredge. Prior to collection at each sample site, the dredge shall be rinsed with deionized water, then ambient water. The sample shall then be collected and deposited into a clean linear polyethylene, or stainless steel pan. The sediment sample should be characterized as non-cohesive. If consolidated clay is collected, the sample is to be discarded, since it would not be representative of the shoal material in the channel bottom.

Using a clean stainless steel or teflon spoon, the sample that is to undergo chemical analyses is to be mixed thoroughly, then placed into a pre-cleaned glass jar. The jar is to be completely filled so as to avoid head space. The lid shall then be tightly secured, and the sample jar is to be placed into an ice chest, containing sufficient cushioning material to prevent breakage.

The water depths at the channel sample sites should be approximately 10 to 15 feet below Mean Low Tide. Depths more shallow are probably not within the channel template and deeper depths will be beyond the dredging depth.

Water Samples

A suitable non-contaminating pump, such as a metal-free bilge pump shall be used to collect water samples. Food-grade hoses shall also be used. The depth of the water sample shall be between mid-depth to 1/3 of the way to the bottom. Under no circumstances should the water intake hose end be any closer than 1.0 meter from the sediment surface. The initial pumped water equaling at least five times the hose volume shall be discarded. The water sample shall then be collected into suitable pre-cleaned bottles. Polyethylene or glass bottles with appropriate acid preservatives shall be used for metals analyses. Also, water samples to be analyzed for metals, other than mercury and selenium, are to be filtered through a clean 0.45µm filter prior to dispensing into containers with acid preservatives. Water samples to be analyzed for mercury and selenium shall not be filtered prior to dispensing into containers with acid preservatives. Pre-cleaned brown glass bottles shall be used for organics analyses. Bottles are to be filled completely, avoiding the presence of any air bubbles in the sample bottle.

Sample Preservation and Storage

A suitable method for preservation and shipment of water and sediment samples must be used. The samples must be stored at 2°C to 4°C, never frozen, immediately after collection. Analyses are to be performed within the recommended holding times, as described in the referenced guidance documents.

Sample Sites

The following table describes the sample designation and location for each sample to be collected. The locations are also depicted on the enclosed plan sheets. Each sediment sample shall represent a composite of separate samples of equal volume collected from the locations described in the following table. If the depths at these positions are not within the range specified above, the position shall be adjusted the least amount possible to meet all requirements.

* W = Analysis of a water sample

S = Analysis of a sediment sample

E = Analysis of an elutriate sample

GS = Grain-size analysis

Chain of Custody

Appropriate Chain of Custody protocols shall be followed. Guidance can be found in U.S. EPA (1986), U.S. EPA and USACE (1995), U.S. EPA and USACE (1998), and Plumb (1981).

Chemical Analyses

Each of the composite samples shall undergo the analyses shown in the Table above. These samples shall entail bulk sediment, water, elutriates and grain-size. All analyses shall be performed by a laboratory accredited by an accrediting authority recognized by the National Environmental Laboratory Accreditation Program (NELAP) for the analytes/analyte groups and matrices to be analyzed. All analyses shall be performed within the holding period described in the referenced guidance documents. Parameters to be analyzed are listed in the following table, along with required detection limits. Sediment sample data shall be reported as dry weight.

**Target Detection Levels^a (TDLs)
for Analysis of Sediment, Water, and Elutriate**

Chemical	Sediment	Water/Elutriate
Metals^e		
	mg/kg	µg/l
Antimony	2.5	3 (0.02) ^c

^aThe primary source of these TDLs was EPA 823-B-95-001, *QA/QC Guidance for Sampling and Analysis of Sediments, Water and Tissues for Dredged Material Evaluations*.

^bThese values are based on recommendations from the EPA Region 6 Laboratory in Houston; these values were based on data or other technical basis.

^cThe values in parentheses are based on EPA “clean techniques”, (EPA 1600 series methods) which are applicable in instances where other TDLs are inadequate to assess EPA water quality criteria.

^dThis value recommended by Houston Lab using colorimetric method.

^eMetals shall be expressed as Dissolved values in water samples, except for mercury and selenium, which shall be reported as Total Recoverable Concentrations.

Laboratory Quality Control

The Laboratory Quality Control program must include, but not be limited to:

- a) The laboratory shall have current accreditation status, consistent with standards adopted by the National Environmental Laboratory Accreditation Conference (NELAC).
- b) Method Blanks - Shall be performed at a frequency of one per batch of samples, per matrix type, per sample extraction or preparation method.

- c) Laboratory Control Samples – Shall be analyzed at a minimum of 1 per batch of 20 or less samples per matrix type, per sample extraction or preparation method, except for analytes for which spiking solutions are not available.
- d) Matrix Spikes – Shall be performed at a frequency of 1 in 20 samples per matrix type, per sample extraction or preparation method, except for analytes for which spiking solutions are not available. The spike concentration shall be no greater than 25% to 50% of the maximum concentration along the linear segment of the instrument calibration curve for any analyte.
- e) Matrix Spike Duplicates – Shall be analyzed at a minimum of 1 in 20 samples per matrix type, per sample extraction or preparation method.
- f) Surrogates – Surrogate compounds must be added to all samples, standards, and blanks for all organic chromatography methods except when the matrix precludes its use or when a surrogate is not available.
- g) Field Equipment Blanks – Analysis shall be performed at a frequency of one per batch of samples collected.
- h) Calibration of instrumentation and performance of periodic instrument checks according to manufacturer and EPA recommendations, and appropriate SOPs.
- i) Participation in performance evaluation and method studies available from EPA, American Society for Testing and Materials (ASTM), or other agency. Performance evaluation under such a program is to be conducted, at least, on a semiannual basis.
- j) Each new shipment or lot of solvent, reagent or adsorbent will be evaluated for purity in accordance with appropriate SOPs.
- k) Standards will be prepared and verified in accordance with appropriate SOPs.
- l) Calculation of QC limits and preparation of control charts will be performed in accordance with appropriate SOPs.
- m) Out of control events, or outlier data will be noted and corrective action will be taken in accordance with appropriate SOPs.

Documentation of all Quality Control activities performed specifically in conjunction with this project is to be furnished along with sample results. Copies of all raw data, lab notes, chromatograms, standard curves, etc. shall be furnished upon request.

Report

Deliverables shall include a brief letter report for each of the 3 project areas. The reports are describing sampling activities, chemical data, and Quality Control data requested above. Only one hard copy of each report shall be submitted. In addition to the hard copy, a CD-ROM shall be

provided, and shall contain MS Word and/or Excel files used to report the required data, along with a PDF formatted version of the final report. Also, PDF files of all laboratory reports for chemical and physical analyses/characterization as well as Laboratory Electronic Data Deliverables (EDDs) in Excel format only.

Schedule

The work described in this Scope of Work shall be completed according to the following schedule and in the following order:

GIWW: Freeport to Caney Creek

Field Work (Sample Collection).....	30 Days after NTP
Laboratory - Chemical Analyses Completed.....	90 Days after NTP
Submit Data Report.....	120 Days after NTP

GIWW: Across Aransas Bay

Field Work (Sample Collection).....	130 Days after NTP
Laboratory - Chemical Analyses Completed.....	190 Days after NTP
Submit Data Report.....	220 Days after NTP

Chocolate Bayou

Field Work (Sample Collection).....	230 Days after NTP
Laboratory - Chemical Analyses Completed.....	290 Days after NTP
Submit Data Report.....	350 Days after NTP

Table 2
Parameters Determined by Chemical Analysis
GIWW Across Aransas Bay - November 2017

Volatiles		
Ethylbenzene	Trichloroethene	Xylenes, Total
Tetrachloroethene		
Semivolatiles		
1,2,4-Trichlorobenzene	4-Chloro-3-methylphenol	Diethyl phthalate
1,2-Dichlorobenzene	4-Nitrophenol	Dimethyl phthalate
1,2-Diphenylhydrazine as Azobenzene	Acenaphthene	Di-n-butyl phthalate
1,3-Dichlorobenzene	Acenaphthylene	Di-n-octyl Phthalate
1,4-Dichlorobenzene	Anthracene	Fluoranthene
2,4,6-Trichlorophenol	Benzidine	Fluorene
2,4-Dichlorophenol	Benzo(a)anthracene	Hexachlorobenzene
2,4-Dimethylphenol	Benzo(a)pyrene	Hexachlorobutadiene
2,4-Dinitrophenol	Benzo(b)fluoranthene	Hexachlorocyclopentadiene
2,4-Dinitrotoluene	Benzo(g,h,i)perylene	Hexachloroethane
2,6-Dinitrotoluene	Benzo(k)fluoranthene	Indeno(1,2,3-cd)pyrene
2-Chloronaphthalene	Benzoic acid	Isophorone
2-Chlorophenol	Benzyl alcohol	Naphthalene
2-Methylnaphthalene	Bis(2-chloroethoxy) methane	Nitrobenzene
2-Methylphenol	Bis(2-chloroethyl) ether	n-Nitrosodimethylamine
2-Nitrophenol	Bis(2-chloroisopropyl) ether	n-nitrosodi-n-propylamine
3,3-Dichlorobenzidine	Bis(2-ethylhexyl)phthalate	n-Nitrosodiphenylamine
3&4 Methylphenol	Butyl benzyl phthalate	Pentachlorophenol
4,6-Dinitro-2-methylphenol	Chrysene	Phenanthrene
4-Chlorophenyl phenyl ether	Dibenzo(a,h)anthracene	Phenol
4-Bromophenyl phenyl ether	Dibenzofuran	Pyrene
Organochlorine Pesticides		
4,4'-DDD	Chlordane	Endrin Aldehyde
4,4'-DDE	Delta-BHC (d-BHC)	Endrin Ketone
4,4'-DDT	Dieldrin	Gamma-BHC (g-BHC or y-BHC)
Alpha-BHC (a-BHC)	Endosulfan I	Heptachlor
Alpha-Chlordane (a-Chlordane)	Endosulfan II	Heptachlor Epoxide
Aldrin	Endosulfan Sulfate	Toxaphene
Beta-BHC (b-BHC)	Endrin	Gamma-Chlordane (g-Chlordane or y-Chlordane)
Metals		
Antimony	Copper	Thallium
Arsenic	Lead	Zinc
Beryllium	Nickel	Chromium(3+)
Cadmium	Selenium	Chromium(6+)
Chromium	Silver	Mercury
Polychlorinated Biphenyls		
Total PCB		
Miscellaneous Parameters		
Ammonia (Water/Elutriate Only)	Grain Size (sand)	Total Petroleum Hydrocarbons
Cyanides	Grain Size (silt)	Total Solids/ Dry Weight

LABORATORY ANALYSIS REPORT

8725 Fawn Trail - The Woodlands, TX 77385 - www.NWDLS.com - (936) 321-6060

Project ID :

GIWW Across Aransas Bay (5024)

Report To : Anamar Env Consulting, Inc.
2106 NW 67th Place

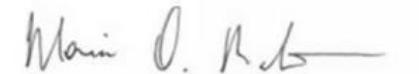

Attn: Terence Cake

Gainesville, FL 32653

Dear Terence Cake,

The following test results meet all NELAP requirements for analytes for which certification is available. Any deviations from our quality system will be noted in the case narrative. All analyses performed by North Water District Laboratory Services, Inc. unless noted.

For questions regarding this report, contact Monica Martin at 936-321-6060.

A handwritten signature in black ink, appearing to read "Monica O. Martin".

Monica O. Martin
Laboratory Director

CASE NARRATIVE

8725 Fawn Trail - The Woodlands, TX 77385 - www.NWDLS.com - (936) 321-6060

Client Name: Anamar Env Consulting, Inc.

Project ID: GIWW Across Aransas Bay (5024)

Date Received: 11/09/2017

Collected By: Dillon Johnston - Lloyd

A total of 33 samples were collected from 11/07/2017 - 11/08/2017. They were received at NWDLS on 11/09/2017 properly thermally preserved and intact. These samples received a job number of 1711131. The lab sample (job sample) IDs, client sample IDs, and dates of collection can be found at the top of each result page. All method specified calibrations and quality control performance criteria were met for this job. For additional information, please refer to the included quality control data pages, chain of custodies, and provided EDD.

NWDLS provided their lowest detection limit for all requested parameters. Note that detection and reporting limits are adjusted to account for sample specific parameters.

Any QC that did not meet the laboratory specified control limits was flagged and reported with qualifiers. No data was affected by QC outside the laboratory specified control limits.

Mmartin

Lab Director

Client Name : Anamar Env Consulting, Inc.		Contact : Terence Cake
Client Address : 2106 NW 67th Place		Contact Phone : 352-377-5770
JobID : 1711131	Date Received : 11/09/2017	Time Received : 09:36 AM
Temperature : 3.0 degrees C	Sample pH : Verified upon receipt and/or sample set up.	
ThermometerID : FTI003	pHPaperID : CRL-69632-29	
Comments : Include actions taken to resolve discrepancies/problem:		

	Check Points	Yes	No	N/A
1	All samples were logged or labeled.	✓		
2	Bottle count on C-O-C matches bottle received	✓		
3	C-O-C signed and dated.	✓		
4	Cooler seal present and signed.			✓
5	If requested, sample(s) received with signed sample custody seal			✓
6	Sample amount is sufficient for analyses requested	✓		
7	Sample containers arrived intact. (if no, comment)	✓		
8	Sample ID lables Match C-O-C ID's	✓		
9	Sample received at 6°C or Less	✓		
10	Sample(s) in a cooler.	✓		
11	Sample(s) were received in appropriate contatiner. (If no, comment)	✓		
12	Sample(s) were received with proper preservative.	✓		
13	Samples accepted.	✓		
14	Samples received within holding time for analysis requested	✓		
15	Zero headspace in liquid VOA vials	✓

TERM AND QUALIFIER DEFINITION

8725 Fawn Trail - The Woodlands, TX 77385 - www.NWDLS.com - (936) 321-6060

General Term Definition

Conc.	Concentration
DF	Dilution Factor - the factor applied to the reported data due to sample preparation, dilution, or moisture content

mg/l	Milligrams per Liter
mg/kg	Milligrams per Kilogram
ppm	Parts per Million
µg/L	Micrograms per Liter
µg/g	Micrograms per Gram
ppb	Parts per Billion
gr/gal	Grains per Gallon
SU	Standard Units
CCU	Cobalt Color Units
NTU	Nephelometric Turbidity Units
µS/cm	Microsiemens per cm at 25C
P/A	Presence/Absence
CFU	Colony Forming Units
MPN	Most Probable Number
RB	Reagent Blank
MB	Method Blank
LCS	Laboratory Control Sample
LCSD	Laboratory Control Sample Duplicate
LFM	Laboratory Fortified Matrix (MS – Matrix Spike)
LFMD	Laboratory Fortified Matrix Duplicate (MSD – Matrix Spike Duplicate)
DUP	Sample Duplicate
RPD	Relative Percent Difference
%Rec	Percent Recovery
TNTC	Too numerous to count
NC	Not Calculable
SG	Silica Gel - Clean-Up
BRL	Below Reporting Limit
BDL	Below Detection Limit

Qualifier Definition

B	Analyte was found in the associated method blank.
---	---

TERM AND QUALIFIER DEFINITION

8725 Fawn Trail - The Woodlands, TX 77385 - www.NWDLS.com - (936) 321-6060

J1	Estimated value-The reported value failed the established quality control criteria for accuracy and /or precision.
P	Difference between GC column results greater than 40% RPD. Higher result reported.
S	The surrogate recovery was outside the established laboratory recovery limit.
U	Non-detected compound.
MDL	Method Detection Limit – The minimum concentration of a substance (an analyte) that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero. Based on standard deviation of replicate spiked samples taken through all steps of the analytical procedure following 40 CFR Part 136 Appendix B.
SDL	Sample Detection Limit – The minimum concentration of a substance (an analyte) that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero. The SDL is an adjusted limit thus sample specific and accounts for preparation weights and volumes, dilutions, and moisture content of soil/sediments. If there are no sample specific parameters, the MDL=SDL.
LOQ	Limit of Quantitation - Analyte concentration that corresponds to the lowest level lab reports with confidence in accuracy of quantitation and without qualification (i.e. J-flagged). The LOQ is at or above the lowest calibration standard.
LRL	Laboratory Reporting Limit – Analyte concentration that corresponds to the lowest level lab reports with confidence in accuracy of quantitation and without qualification (i.e. J-flagged). The LRL is an adjusted limit thus sample specific and accounts for preparation weights and volumes, dilutions, and moisture content of soil/sediments. If there are no sample specific parameters, the LOQ=LRL.
TDL	Target Detection Limit – Performance goal set greater than the lowest, technically feasible detection limit for routine analytical methods and less than the available regulatory criteria or guidelines for evaluating dredged material.
J	Estimated value - The reported value is between the detection limit (MDL/SDL) and quantitation limit (LOQ/LRL).

TDL - Target Detection Limit – Performance goal set greater than the lowest, technically feasible detection limit for routine analytical methods

LOQ - Limit of Quantitation - Analyte concentration that corresponds to the lowest level lab reports with confidence in accuracy of quantitation

LRL - Laboratory Reporting Limit – Analyte concentration that corresponds to the lowest level lab reports with confidence in accuracy of quantitation

MDL - Method Detection Limit – The minimum concentration of a substance (an analyte) that can be measured and reported with a 99% confidence

SDL - Sample Detection Limit – The minimum concentration of a substance (an analyte) that can be measured and reported with a 99% confidence

Q - Data Qualifier

J - Estimated value - The reported value is between the detection limit (MDL/SDL) and quantitation limit (LOQ/LRL).

B - Analyte was found in the associated method blank.

U - Non-detected compound.

P - Difference between GC column results greater than 40% RPD. Higher result reported.

S - The surrogate recovery was outside the established laboratory recovery limit.

and less than the available regulatory criteria or guidelines for evaluating dredged material and without qualification (i.e. J-flagged). The LOQ is at or above the lowest calibration standard and without qualification (i.e. J-flagged). The LRL is an adjusted limit thus sample specific and accounts for preparation weights and volume that the analyte concentration is greater than zero. Based on standard deviation of replicate spiked samples taken through all steps of the method it is evidence that the analyte concentration is greater than zero. The SDL is an adjusted limit thus sample specific and accounts for preparation weight and volume.

lumes, dilutions, and moisture content of soil/sediments. If there are no sample specific parameters, the LOQ=LF
the analytical procedure following 40 CFR Part 136 Appendix E
hts and volumes, dilutions, and moisture content of soil/sediments. If there are no sample specific parameters, the MDL=SC

Geotechnical Data

LOG OF BORING B-1

SHEET 1 of 1

Rock Engineering & Testing Lab., Inc
6817 Leopard St.
Corpus Christi, TX 78409
Telephone. (361) 883-4555
Fax. (361) 883-4711

CLIENT: RVE, Inc.

PROJECT: Proposed Boardwalk Segment

LOCATION: Goose Island State Park, Rockport, TX

NUMBER: G111118

DATE(S) DRILLED: 02/21/11 - 02/21/11

SOIL SYMBOL	FIELD DATA		LABORATORY DATA							DRILLING METHOD(S): Hollow Stem Auger	
	DEPTH (FT)	SAMPLE NUMBER	SAMPLES	ATTERBERG LIMITS			DRY DENSITY POUNDS/CU.FT	COMPRESSIVE STRENGTH (TONS/SQ.FT)	MINUS NO. 200 SIEVE (%)		
				LIQUID LIMIT	PLASTIC LIMIT	PLASTICITY INDEX					
1	SS S-1	N= 4		20					8	<u>Poorly Graded Sand</u> , with silt, brown, moist, loose.	
2											
3											
4	SS S-2	N= 1		50	61	20	41		65	<u>Sandy Fat Clay</u> , with calcareous deposits, dark greenish gray, moist, very soft. (CH)	
5											
6										<u>Sandy Lean Clay</u> , dark greenish gray, moist, very soft.	
7	SS S-3	N= WOH		30							
8											
9	SS S-4	N= WOH		35						Same as above.	
10											
11	SS S-5	N= WOH		32	44	14	30		61	Same as above. (CL)	
12											
13											
14	SS S-6	N= WOH		31						<u>Sandy Lean Clay</u> , dark greenish gray, moist, very soft.	
15										Boring was terminated at a depth of 15-feet.	
N - STANDARD PENETRATION TEST RESISTANCE P - POCKET PENETROMETER RESISTANCE T - POCKET TORVANE SHEAR STRENGTH											
REMARKS: Boring depth was determined by RETL and boring location was determined by RVE, Inc. Boring operations were performed by EnviroCore, a drilling sub consultant to RETL, at GPS Coord. N 28.128245 W 96.989498. WOH = Weight of Hammer											

KEY TO SOIL CLASSIFICATIONS AND SYMBOLS					
UNIFIED SOIL CLASSIFICATION SYSTEM				TERMS CHARACTERIZING SOIL STRUCTURE	
Major Divisions		Symbol	NAME		
COARSE GRAINED SOILS	GRAVEL AND GRAVELLY SOILS	GW	RED	Well - graded gravels or gravel - sand mixtures, little or no fines	SLICKENSIDED - having inclined planes of weakness that are slick and glossy in appearance
		GP		Poorly-graded gravels or gravel - sand mixtures, little or no fines	FISSURED - containing shrinkage cracks, frequently filled with fine sand or silt; usually more or less vertical
		GM	YELLOW	Silty gravels, gravel - sand - silt mixtures	LAMINATED (VARVED) - composed of thin layers of varying color and texture, usually grading from sand or silt at the bottom to clay at the top.
		GC		Clayey gravels, gravel - sand - clay mixtures	CRUMBLY - cohesive soils which break into small blocks or crumbs on drying
	SAND AND SANDY SOILS	SW	RED	Well - graded sands or gravelly sands, little or no fines	CALCAREOUS - containing appreciable quantities of calcium carbonate, generally nodular.
		SP		Poorly - graded sands or gravelly sands, little or no fines	WELL GRADED - having wide range in grain sizes and substantial amounts of all intermediate particle sizes.
		SM	YELLOW	Silty sands, sand - silt mixtures	POORLY GRADED - predominantly of one grain size (uniformly graded) or having a range of sizes with some intermediate size missing (gap or skip graded)
		SC		Clayey sands, sand - clay mixtures	SYMBOLS FOR TEST DATA
FINE GRAINED SOILS	SILTS AND CLAYS LL < 50	ML	GREEN	Inorganic silts and very fine sands, rock flour, silty or clayey fine sands or clayey silts with	M/C = 15 - Natural moisture content in percent.
		CL		Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays	$\gamma = 95$ - Dry unit weight in lbs/cu ft.
		OL		Organic silts and organic silt-clays of low plasticity	Qu = 1.23 - Unconfined compression strength in tons/ sq ft.
	SILTS AND CLAYS LL > 50	MH	BLUE	Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts	51 - 21 - 30 - Liquid limit, Plastic limit, and Plasticity index.
		CH		Inorganic clays of high plasticity, fat-clays	30% FINER - Percent finer than No. 200 mesh sieve
		OH		Organic clays of medium to high plasticity, organic silts	30 B/F - Blows per foot, standard penetration test.
HIGHLY ORGANIC SOILS		PI	ORANGE	Peat and other highly organic soils	∇ - Ground water table.

TERMS DESCRIBING CONSISTENCY OF SOIL (2)

COARSE GRAINED SOILS		FINE GRAINED SOILS		
DESCRIPTIVE TERM	NO. BLOWS / FT. STANDARD PEN. TEST	DESCRIPTIVE TERM	NO. BLOWS / FT. STANDARD PEN. TEST	UNCONFINED COMPRESSION TONS PER SQ. FT.
Very loose	0 - 4	Very Soft	< 2	< 0.25
Loose	4 - 10	Soft	2 - 4	0.25 - 0.50
Firm (medium)	10 - 30	Plastic (med. Stiff)	4 - 8	0.50 - 1.00
Dense	30 - 50	Stiff	8 - 15	1.0 - 2.00
Very Dense	over 50	Very Stiff	15 - 30	2.00 - 4.00
		Hard	over 30	over 4.00

Field classification for "Consistency" is determined with a 0.25" diameter penetrometer.
