APPROVED JURISDICTIONAL DETERMINATION FORM U.S. Army Corps of Engineers

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD): 8 December 2017

B. DISTRICT OFFICE, FILE NAME, AND NUMBER: Galveston District, SWG-2017-00717, Houston Airport System, WET A, WET B, WET B2, WET B3, WET C, and Garners Bayou

C.	PROJECT LOCATION AND BACKGROUND INFORMATION: State: Texas
D.	REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY): ☐ Office (Desk) Determination. Date: 28 November 2017 ☐ Field Determination. Date(s): 30 November 2017
	CTION II: SUMMARY OF FINDINGS RHA SECTION 10 DETERMINATION OF JURISDICTION.
	re Are no "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the ew area. [Required] Waters subject to the ebb and flow of the tide. Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce. Explain:
В. (CWA SECTION 404 DETERMINATION OF JURISDICTION.
The	re Are "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area. [Required]
	1. Waters of the U.S. a. Indicate presence of waters of U.S. in review area (check all that apply): TNWs, including territorial seas Wetlands adjacent to TNWs Relatively permanent waters² (RPWs) that flow directly or indirectly into TNWs Non-RPWs that flow directly or indirectly into TNWs Wetlands directly abutting RPWs that flow directly or indirectly into TNWs Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs Impoundments of jurisdictional waters Isolated (interstate or intrastate) waters, including isolated wetlands
	b. Identify (estimate) size of waters of the U.S. in the review area: Non-wetland waters: 652.55 linear feet: width (ft) and/or 0.19 acres Wetlands: 2.73 acres
	c. Limits (boundaries) of jurisdiction based on: 1987 Delineation Manual. Elevation of established OHWM (if known):
	2. Non-regulated waters/wetlands (check if applicable): ³ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined to be not jurisdictional Explain:

¹ Boxes checked below shall be supported by completing the appropriate sections in Section III below.

² For purposes of this form, an RPW is defined as a tributary that is not a TNW and that typically flows year-round or has continuous flow at least "seasonally" (e.g., typically 3 months).

³ Supporting documentation is presented in Section III.F.

SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW:

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent":

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY):

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under *Rapanos* have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are "relatively permanent waters" (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary with perennial flow, fill out Section III.D.2 and Section III.D.4.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the water body⁴ is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the water body has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

(i) General Area Conditions:

Watershed size: 1130 square miles
Drainage area: Pick List
Average annual rainfall: 47.84 inches
Average annual snowfall: inches

(ii) Physical Characteristics:

(a) Relationship with TNW:

☐ Tributary flows directly into TNW.

☐ Tributary flows through **Pick List** tributaries before entering TNW.

Project waters are 10-15 river miles from TNW.

Project waters are 1 (or less) river miles from RPW.

Project waters are 10-15 aerial (straight) miles from TNW.

Project waters are 1 (or less) aerial (straight) miles from RPW.

Project waters cross or serve as state boundaries. Explain:

⁴ Note that the Instructional Guidebook contains additional information regarding swales, ditches, washes, and erosional features generally and in the arid West.

	Tributary stream order, if known: First Order
	General Tributary Characteristics (check all that apply): Tributary is: Natural Artificial (man-made). Explain: Manipulated (man-altered). Explain: This portion of Garners Bayou has been re-routed and
channelized.	
	Tributary properties with respect to top of bank (estimate): Average width: 20 feet Average depth: 1 feet Average side slopes: 2:1 Primary tributary substrate composition (check all that apply): Silts Concrete
	☐ Cobbles ☐ Gravel ☐ Muck ☐ Bedrock ☐ Vegetation. Type/% cover: ☐ Other. Explain:
typical of oth	Tributary condition/stability [e.g., highly eroding, sloughing banks]. Explain: Garners Bayou exhibits a cross-section er regional creeks altered for drainage. Presence of run/riffle/pool complexes. Explain: None Tributary geometry: Relatively straight Tributary gradient (approximate average slope): %
(c)	Flow: Tributary provides for: Seasonal flow Estimate average number of flow events in review area/year: 20 (or greater) Describe flow regime: Other information on duration and volume: Surface flow is: Confined. Characteristics: Subsurface flow: Unknown. Explain findings: Dye (or other) test performed:
	Tributary has (check all that apply): Bed and banks OHWM ⁶ (check all indicators that apply): clear, natural line impressed on the bank changes in the character of soil shelving vegetation matted down, bent, or absent leaf litter disturbed or washed away sediment deposition water staining other (list): Discontinuous OHWM. ⁷ Explain:
	If factors other than the OHWM were used to determine lateral extent of CWA jurisdiction (check all that apply): High Tide Line indicated by: oil or scum line along shore objects fine shell or debris deposits (foreshore) physical markings/characteristics tidal gauges other (list): Mean High Water Mark indicated by: survey to available datum; physical markings; vegetation lines/changes in vegetation types.
	emical Characteristics: racterize tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc.). Explain:

⁵ Flow route can be described by identifying, e.g., tributary a, which flows through the review area, to flow into tributary b, which then flows into TNW. ⁶A natural or man-made discontinuity in the OHWM does not necessarily sever jurisdiction (e.g., where the stream temporarily flows underground, or where the OHWM has been removed by development or agricultural practices). Where there is a break in the OHWM that is unrelated to the water body's flow regime (e.g., flow over a rock outcrop or through a culvert), the agencies will look for indicators of flow above and below the break. ⁷Ibid.

Identify specific pollutants, if known: This 2.3-mile relative reach of Garners Bayou is not on the 303 (d) list. However, the portion of Garners Bayou starting 3.25 rivers miles south of the relative reach is on the 303 (d) list. The cause of impairment is bacteria. Additionally, the downstream TNW, Greens Bayou, is on the 303 (d) list. The cause of impairment is bacteria.

(iv)	Bio	logical Characteristics. Channel supports (check all that apply): Riparian corridor. Characteristics (type, average width): Wetland fringe. Characteristics: Habitat for: Federally Listed species. Explain findings: Fish/spawn areas. Explain findings: Other environmentally-sensitive species. Explain findings: Aquatic/wildlife diversity. Explain findings:
2. Ch	aract	eristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW
	(a)	Visical Characteristics: General Wetland Characteristics: Properties: Wetland size: 2.73 acres Wetland type. Explain: Emergent, Scrub-shrub, and Forested Wetland quality. Explain: There are 5 wetlands (WET A, WET B, WET B2, WET B3, and WET C) adjacent to you within the project boundary. According to a review of the FEMA floodplain map and the Houston-Galveston
		l LIDAR data, WET A, WET B, WET B2, WET B3, and WET C are located within the 100-year floodplain of ou and serve as floodplain storage. Project wetlands cross or serve as state boundaries. Explain:
	s Bay	General Flow Relationship with Non-TNW: Flow is: Pick List. Explain: No channelized entrance or egress was observed flowing between the 5 wetlands and ou. The 5 wetlands do not abut Garners Bayou. However, they are within the 100-year floodplain of Garners as such, demonstrate a known hydrological connection to Garners Bayou.
		Surface flow is: Discrete Characteristics: The wetlands are located within the 100-year floodplain of Garners Bayou.
		Subsurface flow: Unknown . Explain findings: Dye (or other) test performed:
of Garn	(c) ers B	Wetland Adjacency Determination with Non-TNW: ☐ Directly abutting ☐ Not directly abutting ☐ Discrete wetland hydrologic connection. Explain: The wetlands are located within the anticipated high flow tayou (i.e. the 100-year floodplain of Garners Bayou)-Neighboring. ☐ Ecological connection. Explain: ☐ Separated by berm/barrier. Explain:
	(d)	Proximity (Relationship) to TNW Project wetlands are 15-20 river miles from TNW. Project waters are 10-15 aerial (straight) miles from TNW. Flow is from: Wetland to navigable waters. Estimate approximate location of wetland as within the 100 - 500-year floodplain.
(ii)	Cha	emical Characteristics: aracterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics; etc.). Explain: ntify specific pollutants, if known: Unknown
(iii) Bio	logical Characteristics. Wetland supports (check all that apply): Riparian buffer. Characteristics (type, average width): Vegetation type/percent cover. Explain: Habitat for: Federally Listed species. Explain findings: Fish/spawn areas. Explain findings: Other environmentally-sensitive species. Explain findings: Aquatic/wildlife diversity. Explain findings:
3. Ch	aract	eristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in the cumulative analysis: 30 (or more)
Approximately (80.67) acres in total are being considered in the cumulative analysis.

For each wetland, specify the following:

<u>Directly abuts? (Y/N)</u> <u>Size (in acres)</u> <u>Directly abuts? (Y/N)</u> <u>Size (in acres)</u>

Summarize overall biological, chemical and physical functions being performed: **Based on our analysis, we determined** there are approximately 34 adjacent wetlands located within this 2.3-mile, first order relative reach of Garners Bayou. All wetlands considered in this analysis are adjacent to, but not abutting, Garners Bayou.

These 34 wetlands total appx 78 acres of adjacent wetlands provide for the removal of pollutants (phytosequestration), floodplain storage, and biotic diversity.

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the *Rapanos* Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below:

- 1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to Section III.D:
- 2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:
- 3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D: This relative reach of Garners Bayou is a first order tributary that is approximately 2.3 miles long. This reach concludes approximately 15 miles upstream of the nearest TNW. Garners Bayou has a direct connection to the downstream TNW. Greens Bayou.
 - -Within the project boundary there are 5 wetlands (WET A, WET B, WET B2, WET B3, and WET C: totaling 2.73-acres) adjacent to this relative reach of Garners Bayou. According to a review of the FEMA floodplain map and the Houston-Galveston Area Council LIDAR data, WET A, WET B, WET B2, WET B3, and WET C are located within the 100-year floodplain of Garners Bayou, and therefore, neighbor Garners Bayou. WET A, WET B, WET B2, WET B3, and WET C, in combination with 34 wetlands located within the 100-year floodplain of Garners Bayou within the 2.3-mile relative reach,

total approximately 80.7 acres. All wetlands considered in this analysis are adjacent to, but not abutting, Garners Bayou. - There is not a surface hydrologic break between this approximate 2.3-mile relative reach of Garners Bayou and the downstream TNW, Greens Bayou; thus, a direct surface hydrologic connection exists. Greens Bayou downstream of this reach is identified on the TCEQ 303(d) list of impaired waters due to bacteria. The approximate 80.7 acres of adjacent wetlands aid in providing important filtration to aid in the reduction and treatment of bacteria, thermal, and chemical pollutants in Greens Bayou. Therefore, the aquatic resources within this review area should provide important sequestrating functions to aid in in the chemical integrity of the downstream TNW, located approximately 15 river miles downstream.

-Within this relative reach of Garners Bayou, there are approximately 80.7 acres of similarly situated adjacent wetlands located within the 100-year floodplain. The TNW, Greens Bayou, begins approximately 15 river miles downstream. The retention of water and retardation of overbank flooding associated with these adjacent wetlands located in a floodplain serve an important functions in and associated with the physical functions of the downstream TNW. The effects of removing approximately 80.7 acres of wetlands would increase the velocity and flow of water into the TNW (Greens Bayou). Increased flow will increase "out of bank" flooding and scouring, resulting in loss of property and the physical attributes of the TNW. These aquatic resources (~ 80.7 acres of wetlands and 2.3 miles of tributary) provide more than speculative or insubstantial effect upon the physical attributes for the downstream TNW.

-There are no known species found in this project area that require these aquatic resources within this relative reach and/or review area and the waters of the TNW to fulfill their life cycle requirements. However, based on the fact that the waterway in this reach is an RPW with a direct hydrologic connection with the TNW, it is highly feasible that species of fishes and/or invertebrates can utilize locations of Garners Bayou for portions of their lifecycles; but there is not sufficient evidence to identify a species that requires both the aquatic resources within this reach and the waters of the TNW to full lifecycle requirements. The aquatic resources within this review area aid and support the biological integrity of the downstream TNW.

-In conclusion, it is the Corps opinion that the waters within this review area: a 2.3-mile, first order stream combined with approximately 80.7 acres of adjacent wetlands do provide more that a speculative or substantial effect upon the chemical, biological and/or physical integrity of the downstream TNW.

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY):

1.	TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area: TNWs: linear feet width (ft), Or, acres. Wetlands adjacent to TNWs: acres.
2.	RPWs that flow directly or indirectly into TNWs. ☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial: The portion of Garners Bayou within the site is a rerouted and channelized extent of the natural Garners Bayou. Water was observed in Garners Bayou in all of the Google Earth aerial images from 2002 to 2017. The feature appears to be fed by direct precipitation and stormwater runoff from the surrounding areas. ☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
	Provide estimates for jurisdictional waters in the review area (check all that apply): Tributary waters: linear feet width (ft) Other non-wetland waters: acres Identify type(s) of waters:
3.	Non-RPWs ⁸ that flow directly or indirectly into TNWs. Water body that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has a significant nexus with a TNW is jurisdictional. Data supporting this conclusion is provided at Section III.C.
	Provide estimates for jurisdictional waters within the review area (check all that apply): Tributary waters: linear feet width (ft). Other non-wetland waters: acres Identify type(s) of waters:
4.	Wetlands directly abutting an RPW that flow directly or indirectly into TNWs. Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands. Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale

⁸See Footnote # 3.

		indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW:
		Wetlands directly abutting an RPW where tributaries typically flow "seasonally." Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW:
		Provide acreage estimates for jurisdictional wetlands in the review area: acres
	5.	Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNWs. Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisidictional. Data supporting this conclusion is provided at Section III.C.
		Provide acreage estimates for jurisdictional wetlands in the review area: 2.73 acres
	6.	Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs. Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
		Provide estimates for jurisdictional wetlands in the review area: acres
	7.	Impoundments of jurisdictional waters. As a general rule, the impoundment of a jurisdictional tributary remains jurisdictional. Demonstrate that impoundment was created from "waters of the U.S.," or Demonstrate that water meets the criteria for one of the categories presented above (1-6), or Demonstrate that water is isolated with a nexus to commerce (see E below).
Е.	SUC	PLATED [INTERSTATE OR INTRA-STATE] WATERS, INCLUDING ISOLATED WETLANDS, THE USE, GRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE, INCLUDING ANY CH WATERS (CHECK ALL THAT APPLY): 10 which are or could be used by interstate or foreign travelers for recreational or other purposes. from which fish or shellfish are or could be taken and sold in interstate or foreign commerce. which are or could be used for industrial purposes by industries in interstate commerce. Interstate isolated waters. Explain: Other factors. Explain:
	Ide	ntify water body and summarize rationale supporting determination:
		vide estimates for jurisdictional waters in the review area (check all that apply): Tributary waters: linear feet width (ft) Other non-wetland waters: acres Identify type(s) of waters: Wetlands: acres
F.		N-JURISDICTIONAL WATERS, INCLUDING WETLANDS (CHECK ALL THAT APPLY): If potential wetlands were assessed within the review area, these areas did not meet the criteria in the 1987 Corps of Engineers Wetland Delineation Manual and/or appropriate Regional Supplements. Review area included isolated waters with no substantial nexus to interstate (or foreign) commerce. Prior to the Jan 2001 Supreme Court decision in "SWANCC," the review area would have been regulated based solely on the "Migratory Bird Rule" (MBR). Waters do not meet the "Significant Nexus" standard, where such a finding is required for jurisdiction. Explain: Other: (explain, if not covered above):

To complete the analysis refer to the key in Section III.D.6 of the Instructional Guidebook.
 Prior to asserting or declining CWA jurisdiction based solely on this category, Corps Districts will elevate the action to Corps and EPA HQ for review consistent with the process described in the Corps/EPA Memorandum Regarding CWA Act Jurisdiction Following Rapanos.

B. ADDITIONAL COMMENTS TO SUPPORT JD: Based on our 30 November 2017 site visit and a review of on and off-site data associated with this request, we have determined that the project area contains waters of the United States, specifically Garners Bayou and wetlands adjacent to but not directly abutting Garners Bayou. Garners Bayou is a relatively permanent water (RPW) that flows directly into Greens Bayou (TNW).

There are 5 wetlands (WET A, WET B, WET B2, WET B3, and WET C; totaling 2.73-acres) adjacent to Garners Bayou within the project boundary. According to a review of the FEMA floodplain map and the Houston-Galveston Area Council LIDAR data, WET A, WET B, WET B2, WET B3, and WET C are located within the 100-year floodplain of Garners Bayou, and therefore, neighbor Garners Bayou. WET A, WET B, WET B2, WET B3, and WET C, in combination with 34 wetlands located within the 100-year floodplain of Garners Bayou within the 2.3-mile relative reach, total approximately 80.7 acres. All wetlands considered in this analysis are adjacent, but not abutting, to Garners Bayou.

There is not a surface hydrologic break between this approximate 2.3-mile relative reach of Garners Bayou and the downstream TNW, Greens Bayou; thus, a direct surface hydrologic connection exists. Greens Bayou is identified on the TCEQ 303(d) list of impaired waters due to bacteria downstream of this reach. The approximate 80.7 acres of adjacent wetlands aid in providing filtration & eliminating and/or treating of bacteria, thermal, and chemical pollutants in Greens Bayou. Therefore, while it appears that the aquatic resources within this reach provide more important chemical functions to the downstream TNW, there is not sufficient evidence to substantiate this empirically.

Within this relative reach of Garners Bayou, there are approximately 80.7 acres of similarly situated adjacent wetlands located within the 100-year floodplain. The TNW, Greens Bayou, begins approximately 15 river miles downstream. The retention of water and retardation of overbank flooding associated with adjacent wetlands located in a floodplain is well documented. The effects of removing approximately 80.7 acres of wetlands would increase the velocity and flow of liquids into Greens Bayou, resulting in a more than speculative or insubstantial effect upon the physical attributes for the downstream TNW. Increased flow will increase "out of bank" flooding and scouring, resulting in loss of property and the physical attributes of the TNW.

There are no known species found in this review that require these aquatic resources within this relative reach and/or review area and the waters of the TNW to fulfill their life cycle requirements. However, based on the fact that the waterway in this reach is an RPW with a direct hydrologic connection with the TNW, it is highly feasible that species of fishes and/or invertebrates can utilize locations of Garners Bayou for portions of their lifecycles, but there is not sufficient evidence to identify a species that requires both the aquatic resources within this reach and the waters of the TNW to full lifecycle requirements. The aquatic resources within this review area aid and support the biological integrity of the downstream TNW.

In conclusion, it is the Corps' opinion that there is sufficient evidence to support the statement that the aquatic resources within this approximate 2.3-mile relative reach and its appx 80.7 acres of adjacent wetlands provide a significant nexus (more than a speculative or insubstantial) effect upon the chemical, physical, and/or biological integrity of the downstream TNW. As such, they are subject to federal jurisdiction under Section 404 of the Clean Water Act.
